Submitting articles

Commodore Magazines welcomes readers' contributions — either articles or program listings. Articles should be typed double-spaced with a wide margin. Programs should, wherever possible, be printed out on plain white paper, accompanied by a cassette. We cannot guarantee to return every article or program submitted, so please keep a copy. If you want to have your program stored you must include an L.R.P.

Commodore Magazines is published monthly by Sunshine Books, Scott Press Ltd, Typset by Le Day Ltd, 15-17 Daffodill Street, London EC1. Printed by Riverside Press Ltd, Thames Way, Whitehall, Kent. Distributed by S&S Distribution, 30-32 Trinity Gardens, London SW9 (telephone 01 779 8601, telex 5814431, BSMR 0245-4344). Registered at the Post Office as a newspaper.

EDITORIAL

THEY SAY that trends started in America will hit the UK six months later. If that's so, the news from the Las Vegas Consumer Electronics Show suggests that the C16 and the Plus/4 have about that much longer to live.

This issue's show report makes it glaringly obvious that the two machines have earned no support from independent US software producers, and so their future must be in doubt. Sales of the C16 have been good in the UK, but it's the American market which must determine its eventual fate.

Commodore's mistake has been to introduce machines which offer no new technology and few extras for the user. Arch rival Atari, meanwhile, has announced a whole series of eight- and sixteen-bit machines at budget prices, with a variety of compatible peripherals and a unique user-friendly colour coding system.

It seems that for once Commodore has been outgunned, and must fight back if the company is to retain its dominance of the world market.

The main weapon will be the C128, which, as our review explains, neatly safeguards the future of the Commodore 64 by offering three modes of operation: a 64-compatible mode perhaps intended mainly for games, a 128K mode for serious users, and a CP/M operating system mode for fully professional use.

If the C16 and Plus/4 were intended as the next generation of Commodore computers, then the idea seems to have failed. If they were intended as stop-gaps which will soon be obsolete, then many buyers will be disappointed. The C128, though, seems to offer a more secure future to Commodore users. Let's hope that this time the independent software producers have more faith in the product.

Instead of ten aliens, C for his Commodore

What happened ne

Saturday morning.

Waltzed into my local computer shop.

Packed as usual with masses of kids enjoying the arcade games.

Surely there must be a better use for my Commodore 64. Helpful assistant suggests a Communications Modem.

Tells me it comes with a year's free subscription to CompuNet, a new network service, saving me a cool thirty quid.

A bargain not to be missed, so I bought a Modem.

If I knew then, what I know now, I'd have thanked that assistant more.

Saturday (one week later).

Fantastic.

My CompuNet membership came through this morning.

Hurriedly plugged the Modem into my 64's cartridge port, and hooked up to the telephone line.

Can't wait.

At last I can communicate with other Commodore 64 Modem-owners and giant mainframes.

What's more, I can also access databases

throughout Europe and the U.S.A.*

This is what home computing's all about.

Sunday morning.

Raining.

Dipped in my CompuNet I.D. and personal password.

Wow, what a directory!

Decide to put my wits against other Modem users by entering Multi User Dungeon, an interactive on-line game.

Should stretch the old grey matter a bit.

Then a quick look in 'The Jungle'. This is an open area where other Modem owners display messages.

See a Commodore user in File wants to sell 'U-boat' for £3.00.

Leave message offering him 'Mighty Gork' on a straight swap.

Monday evening.

Move on to the CompuNet Software Park.

What a choice. Loads of high quality bargain programs.

Particularly interested in educational software, so I call up 'The Study'.

Download free physics package to help with my exams.

...I've bought a Modem for my Commodore 64.

...and it's the next day that it next changed his life.

Tuesday evening.

Dad's turn.
I don't get a look in as he's
busy teleshopping.

Actually it's amazing what bargains turn
up. He even finds a new house.

Mum said she doesn't want to move and
anyway his dinner's getting cold.

Wednesday evening.

Discover I can join BLAISE!
the computer service for
the British Library.

Their catalogue of books dates way
back to 1950.

Should give me an interesting edge over
my school chums.

Thursday evening.

She has a go.
She keys into Pressel!
Imagine, over 500,000 pages of information
and news.

What does she choose? The lonely hearts
section.

She's disappointed. Couldn't find Simon
le Bon's private number.

Friday evening.

Yipped! Receive a reply from
the guy in File.

He fancies taking on Gork.

What's more he's written a program he'd
like my opinion on.

He transfers it direct, using the free user
to user software.

I've made my first computer pal.

It has really been a week.

Best one I've had since getting my
Commodore 64.

Sure am glad I got the Modem instead of
all those aliens.

The Commodore 64 Communications
Modem comes as a complete package with a
year's free subscription to Compu-net, for just
£99.99 inc. VAT.

Find out how a Modem can change your
life. See it now at Dixons, Curry's, Comet and
selected Commodore dealers.

It makes sense...

To have your own **ELECTRONIC DIARY** in which you can file any data which is essential to you. The software team that designed and developed Easy File has now produced such a diary.

DESK DIARY £29.95 (Disk + Manual) for your Commodore 64.

Have you ever wished you had a diary which you could alter at will to suit your requirements year after year? If you have then **DESK DIARY** could be the diary you've always wanted.

DESK DIARY is a powerful Diary Information Management System. It features Powerful **PASSWORD** protection for the entire **DIARY**, **MENU** driven routines and self defined screens.

With **DESK DIARY** you can -

- **Protect** your **DIARY** from unauthorized entry. • **Enter** your **Appointments** and **Engagements** for any date up to 31st of 1993. • **Refer** to your **Appointments** and **Engagements** at any time. • **Hide** your **Appointments** and **Engagements** at any time. • **Call** up for your immediate attention any **Appointment** and **Engagement** at any time. • **Record** important dates, news and ancillary information at any time, e.g. your tax details, your professional address, events and their dates which are important to you. • **Refer** to your recorded information at any time. • **File** and **update** your recorded information at any time. • **Call** up for your immediate attention **ANY** page of your recorded information at any time. • **Receive** a **MESSAGE** for another authorized **DIARY** user. • **Update** the dates of a calendar month in any calendar year from 1980 to 2000. • **Read** **ANY** Data File which has been created by **EASY SCRIPT**, **EASY FILE** and **EASY CALC**. • **Prepare** **ANY** of your **DESK DIARY** Data Files to be used by **EASY SCRIPT**. • **Export** your Data Files, make copies of your Data Files, **Save** entire Data Files, **Remove** your Data Files

It's ingenious...

AND IT'S FROM THE SOFTWARE TEAM THAT DESIGNED AND DEVELOPED **EASY FILE**

DIGITAL LAB £29.95 (Disk + Manual) for your Commodore 64

Design your own **LOGIC CIRCUITS** using **AND**, **OR**, **NOT**, **EXCLUSIVE OR** Gates, **INVERTER** (NAND), **Trigger** (SR), **SR**, **JK**, **LAB**, **SHIFTER** and **JUNCTIONS** with this ingenious Software Program.

DIGITAL LAB is a powerful Program, which performs various functions of a **LOGIC LABORATORY**. With **DIGITAL LAB** you can design and construct your own **LOGIC CIRCUITS**. You can select any **LOGIC**, **SR**, **JK** and **SHIFTER** (SR) from a comprehensive set of **8088/80**. **DIGITAL LAB** will create the outline of every **LOGIC GATE** and **LOGIC LAB** in your **DIAGRAM**. It will analyze your **LOGIC CIRCUIT** and the results of the analysis will be displayed in a **TRUTH TABLE** with the corresponding Boolean Expression.

DIGITAL LAB contains many other features and **LIFE FILES** which are very useful to such an Application including a set of **One Minute Drawing** (ETC/ETB) which allows you to **FORMAT** all your Data, make copies of your Data, **DELETE** entire Data Files and **RENAME** your Data Files.

DIGITAL LAB is a unique tool for pupils, students and anyone else who would like to extend their practical approach to Designing and Constructing **LOGIC CIRCUITS**. With our use of **8088/80** **LAB** understanding is **LOGIC** simple and is made very easy and you can enjoy the atmosphere of a **LOGIC LABORATORY** in the comfort of your own home.

DIGITAL LAB is easy to operate and will help to provide a clear understanding of Boolean algebra with reference to **LOGIC** (8088/80). It is written in Commodore 64, 6502 Assembly language and is therefore very fast in its operations.

Send for your own **DIGITAL LAB NOW**

Beach boys

I WONDER if fellow Beach-Head players would be interested in the following points.

Ignore the secret passage — go straight for the fires. If the surveillance aircraft is hit dead centre, it will continue to add 2000 points to your score as long as you keep hitting it. For this reason, play at Level 1 to attain maximum ammunition.

By counting the number of fighters you hit you can judge when the next surveillance aircraft will be on screen.

It pays to lose some ships at this stage in order to reach up high scores by shooting down fighters.

Allow five ships to be sure of defeating the battleships. The distances of these ships varies from game to game, but the relative distances from each other remain the same — for instance if the aircraft carrier is at 52.5 degree elevation, the other ships from left to right are at 68.5, 68.5, 74.5 and 24.5 degrees.

Hitting get right tanks to the beachhead, every tank and bunker hit will score you points if hit early enough — it pays to get your fire tank through to Kato-Lin as this offers more obstacles and hence potential points each time.

Having decided on the most profitable screen, crash your tanks at the final bridge until you can be sure of destroying the fortress with, say, your last tank.

Using these techniques I've achieved a high score of 533,000 — but even then I've dropped several thousand points here and there!
Edward Lister

York

16K Vic ≠ C16, OK?

I OWN A Vic 20 and 16K expansion pack. I notice that the C16 has only 12K of RAM free to the user — does that mean that it might be possible to convert C-16 software to run on the Vic — 16K, or vice versa?

G J Thomas
Ammersford
Oxford
VIC 20 Basic programs will

run on the C16, but it would be difficult to convert C16 programs to run on the Vic since the C16's Basic has several more complex commands. Commercial programs couldn't be converted in a practical way — the memory maps of the machines are totally different.

The CP/M business

I HAVE A 64 and intended to get a disk drive and CP/M cartridge to run COROL. I am interested in pursuing a career which involves computers, particularly in the accounts field. Can you give me some advice on how to learn more about the subject, and on the status of the Commodore CP/M cartridge and using it with COROL?
A Dwyer
Aldford
Oxon

THERE'S NO practical way

to learn about business systems except to take a course such as an BNC through a technical college. Commodore's CP/M cartridge has been quoted in some specialist London retailers — it consists basically of a Z80 chip. Though we don't yet know if Commodore's implementation of CP/M allows standard versions of COROL to be run, the new C128 will include a CP/M facility which may be easier to work with, if you can wait for the machine to become available. Try phoning Commodore's technical information service on 0844-283251 for more help.

£10 prize letter

Each month we'll give a £10 prize for the most interesting letter on hardware, software, computing, or life in general. The ball's in your court... get writing!

This is the chance to air your views — send your tips, complaints and compliments to Letters Page, Commodore Horizons, 12-13 Little Newport Street, London WC2H 7PP

Copyright fight

I AM THINKING of developing an adventure program for sale. I think it best to sell it to a company rather than to market it myself. I have no experience of dealing with companies which market software, but it would appear very easy for any company receiving software to copy it for sale without paying me. Is there any way around this problem?
A E Alford
Winton
Bournemouth

ANY ORIGINAL work is copyrighted by the very act of creating it — there is no need for it to be registered in any way. The best way to defend your copyright is to deposit a copy of the work with a solicitor, so that in case of any breach of your copyright you will have proof of ownership. Legal action is expensive but is very rarely needed — most software companies are too aware of the problems of copyright to knowingly violate your rights.

PC — compatible on the way

DK buys Currah

CURRAH COMPUTERS, distributor of the Speech 80 voice synthesizer, has gone into receivership. After an initial announcement that the Speech 80 and other Currah products would be sold by the assembler, Welwyn Electronics, established peripherals and software manufacturers DK'Tronics stepped in to buy Currah. Roger Barnard, marketing manager of DK'Tronics commented "we have bought the rights to the Currah trading name, and the exclusive copyright to the Currah range."

DK'Tronics plans to re-open its US branch to market the Speech 80, Minivoice Adman Electronics, producer of the rival Adman Speech Synthesizer, has announced a new device compatible with Commodore's Magic Voice software. Although programs like BJ and the Bear are already available, the Magic Voice unit may never be distributed in large numbers. The Adman unit is compatible with all software designed for the old Adman speech synthesizer, which is to be discontinued, and with 95% of the vocabulary of Magic Voice. Adman's Mike Shostrack explained "The commands and syntax are the same as Magic Voice, but words stored using the extended VOC command on the Magic Voice may not work on the new Speech Maker. In those cases the Speech Maker will voice a phrase."

"The Speech Maker copes with phonetic word construction and perfect vocabulary, so it gives the best of both worlds. We've simplified the method of operation, and hope to make it available in February at £25.95."

We'll be carrying more details of the Speech Maker in our forthcoming speech synthesizer roundup. Meanwhile contact Adman at Epsom Way, Harnsey, N. Yorks. 0623-740973.

COMMODORE'S IBM PC-compatible machine was seen in working form for the first time in the UK at the Which Computer Show in Birmingham. Although the unit was seen in operation running WordStar and Silcock Office, there were no details available on the operating system, cost, or date of availability. Next-summer PLC has been appointed as national dis-

tributor of all business systems.

Commodore affirmed its commitment to the business market — specifically the PC and the 8088 series machines — which leaves the Plus/4 looking as if it will be left in the cold again. See the Las Vegas CES report in this issue for more details of the new Commodore personal computers.

Business and pleasure from Impex

IMPEX SOFTWARE has announced two products designed for C16 — Plus/4 users. Company Par 0193 is the first business program for the Plus/4 to receive official Commodore Approved status. It includes sales ledger, purchase ledger, inventory, stock control, control ledger, profit and loss and balance sheet facilities integrated on one disk.

The program will cost £98.95, or only £50.95 for the first 20 purchasers. There's

also a CBM 64 version planned, which will be compiled for greater

operational speed.

For less serious applications the XBI joystick adapter allows you to use standard 2-pole joysticks with your Plus/4 and C16. Costing £2.25, the XBI has a standard Commodore joystick socket on one end and the new miniature 8-pin DIN plug on the other, so you don't have to throw away your favourite joystick. Contact Impex at Merry House, Second Way, Wembley, Middlesex, 01-990 8000.

Interceptor's latest stunts

GAMES SPECIALIST Interceptor Micro's has announced plans for the next batch of Commodore releases.

Bigtop Barney features a clown who must complete four death-defying acts to win the applause of the crowd. These

include tightrope walking, pedalling a unicycle and trampolining. The game will cost £7.95. Caverns of Sillago is a space adventure in which you must pilot a ship through alien caverns to recover your stolen agricultural devices. Hazards include mines, rocks and landmines. The game also costs £7.95. Villain runs on the 8 or 16K. We and costs £6.95. It's an arcade extravaganza in which you must proceed in your life of crime while avoiding the unwelcome attention of PC Plodd. Laddy Break Fever allows you to control an magnetic dancer with your joystick. The 64 game features head spins, turtles, back slams and "The Slammer", and as a bonus the B side of the tape features a specially mixed audio version of the game theme tune.

Contact Interceptor at Linden House, The Green, Tadley, Hants, 07156-3711 for more details.

Tandata turns up trumps

COMMUNICATIONS specialist Tandata has announced a new software package which provides extra facilities such as saving incoming data to disk, printing incoming line data in scroll mode with 40 or 80 columns, word processing facilities and sending data direct from disk in 800/300 mode.

Smart Modem is available on disk and costs £M + VAT. The 64 version includes a full manual, and can be obtained from Tandata, Albert Road North, Malvern, Worcestershire, 06845-68421.

The company has also announced a price cut for its TM200 multi-head rate modem. The TM200, which offers 75/1200, 1200/75, 1200/1200 and 300/300 baud rates, will now be £173 including VAT, a drop from £177. Tandata's MD Roy Penfold said "The price cut has been made possible by the increased volume of production and sales throughout our product range, which enables us to pass on the benefits to our customers."

"Pack your bags, pachyderm" — CBM jumbo lumbers off

COMMODORE's big Christmas advertising campaign ran into trouble with the RSPCA — after the event.

The campaign, which culminated in a television advertisement showing an elephant in boxing gloves, drew several complaints from members of the public. As a result the RSPCA objected, and the IBA, responsible for the content of all TV advertising, requested the advert to be discontinued. "By that time", commented Bob

Johnson of Commodore's ad agency Grandfield Ross Collins, "the campaign had finished anyway, in any case, the script had been cleared with the Independent Television CONFEDERATION Association, and we had contacted the RSPCA before the ad was made. Their press officer told us that as long as the regulations on the treatment of animals were adhered to they had no objection to the ad. Unfortunately the press officer con-

cerned left the RSPCA, so they thought that we had not cleared the ad with them when the complaints arose."

"It seems we were singled out by a vociferous minority — we wouldn't condone any ill-treatment of animals, and no mention was made of other campaigns featuring chimps, labradors and parrots."

"We're now planning next year's campaign, but since we don't yet know what angle it will be based on it's too early to say what form it will take."

New progs aimed at Plus/4, C16

COMMODORE has announced a range of cassette and disk programs for the C16 and Plus/4, covering the games, education and utilities markets.

Smart Programming with Zorkik and the Kryptobites is a sequel to the popular Zorkik and the Microbits. It will be available on disk or cassette. **Hide and Seek**, **Number Builder** and **Number Chase**

are educational games intended to develop memory, shape recognition and arithmetic skills. **Jack Attack**, **Yiddish**, **Pinch Adventure**, **Atomic Mission** and **Strawp Odyssey** are cartridge based games, most of which are priced at £19.95. **Mayhem**, **Harbour Attack**, **Stirler Wars/Bike**, **Cross Golf** and **Five Ant** are cassette games costing £3.95.

There are six Infocom disk-based adventure games planned for the Plus/4 only: **Dark /1/2/3**, **Starcross**, **Deadline** and **Sagecat**.

Further in the future are **Introductions to Basic Parts 2** and **3**, **Games Designer**, and for the Plus/4 only **Magik Disk 2**, a cartridge based introduction productivity program, and **Tony Hart's Art Master**, an adaptation of the CBM 64 program.

We'll be reviewing all these products as soon as they're available. Meanwhile contact Commodore at 1 Hunter's Road, Widdow North Industrial Estate, Corby, Northants.

CIL lets SX-64 get the information

CIL MICROSYSTEMS has introduced a Commodore SX-64 version of the ADS data acquisition unit designed for the PET.

The ADS interface fits into the slot in the front of the SX-64, and has four analogue inputs, two analogue outputs, plus or minus ten volts open plus 12 bit accuracy, four TTL inputs, and four relay closures for control applications. The interface is programmed in CBM Basic.

The entire system, with SX-64, ADS interface and software costs £1455. Alternatively the interface can be bought separately for £280.

For more details contact CIL Microsystems, Dever Road, Warrington, Salford, BN14 8NS, 0905-218474.

SOFT★HITS

What an old banger

Oh dear, oh dear. Having commented before on how computer games based on films and TV shows tend to be disappointing, my claims are borne out by this somewhat degraded version of Automan.

the failed American TV series screened here a few months

back Automan is a holographic projection used by a

police scientist as a super-crime fighter. Playing this game made me feel pretty transparent.

How can I convey the rawling piff between the hype for this game and the dire reality? Start with an introductory screen looking like a fourth-rate Miami Mirror, then proceed into a scenario of mind-numbing banality dealing with a mad bomber on the loose. Add as the final

touch a main game sequence which looks like some ancient Spectrum 3.00 maze game, and you have the entirety of Automan. How on earth did Big Brother get saddled with this cranking disaster?

Program: Automan, 64
Supplier: Bug Byte
Price: 19.95
Graphics: ★★
Sound: ★★
Gameplay: ★★

A lovely war

Front Line is nothing to do with the arcade game of the same name, but it is a jolly good war-mangling romp all the same. You control a little tank wandering around an island landscape seen from above. The details are colourful and the scrolling exceptionally good.

As you wander around looking for fuel supplies, you must fend off attacks from planes, helicopters and roving

firebombs. Fuel supplies and armour strength are re-

plenished by finding a supply dump.

Firing is quite tricky to master, since you must press the joystick button to shoot and release it at the right moment to detonate the shell when it's over the target.

If there's anything more to the game I haven't found it, so it remains a graphically engaging but ultimately pretty average offering. Props though the stirring martial music by Chris Cox.

Program: Front Line, 64
Supplier: Interceptor
Price: 17.00
Graphics: ★★★★★
Sound: ★★★★★
Gameplay: ★★★★★

Don't rock the boat

Back to the sports theme, based on an offering from the promising New Generation, whose Cliff Hanger was reviewed last month. The self-explanatory *Shoot the Rapids* is a canoeing simulation with smooth-scrolling graphics which demands a good deal of

precision to turn in a satisfactory performance.

Like slalom skiing, the

object of the game is to pass through a series of gates in an set time. The canoe is con-

trolled by setting up a steady left-right rhythm with the joystick or user-definable keys. This propels you forward, hopefully through the gates. Should you run into trouble — or the bank — pressing the fire button enables you to paddle backwards.

Penalty times are added if you miss a gate, and it can be very difficult to steer through them without banking into the bank, in which case you sink without a trace.

Additional features include varying water speeds, the occasional rock or man-of-war, and curious beavers.

An original and challenging offering, which could perhaps have been improved with a two-camera option.

Program: Shoot the Rapids, 64
Supplier: New Generation
Price: 17.95
Graphics: ★★★★★
Sound: ★★
Gameplay: ★★★★★

Googlies

Cricket is normally such a miserably tedious game that putting it onto a computer could only improve it, if only by shortening the time of play.

The Laser's version for the 64 is an excellent attempt to capture the skill of cricket without the accompanying boredom. There's a wide range

of player-defined variables, team names, team numbers, members' skill levels, play level and so on. All these are selected by the joystick which is necessary to play the game.

The action takes place in two parts: a large-scale animation which shows the bowler's delivery and gives the batsman a chance to respond, then a panoramic screen in which the players can control the run-outs and the fielders.

The animation is good, although it fails the test of the

crowd and the sound of the stool drama — the sound effects are minimal. Still, it's

nice to see a game which can be played by one player against the computer, or by two players using two joysticks. Cricket fans will love it, and non-fans may even be converted.

Program: Cricket, 64
Supplier: Praxish
Price: 13.95
Graphics: ★★★★★
Sound: ★★
Gameplay: ★★★★★

SOFT★HITS

SOFT★HITS

Time buggy?

A neat combination of two computer arcade games, **Time Pilot** and **Mouse Buggy**, **Battle Through Time** doesn't offer anything much new but it's a nice little package nonetheless.

You control a fighting vehicle through several time

zones, each one of which features a conflict which will determine the course of human history. In each one, your buggy, which can shoot upwards and forwards, must fight off enemy air attacks while destroying obstacles and jumping over potholes. In each time zone you must travel ten miles to the next transporter.

You'll have to do very well to avoid the bombs, potholes and obstacles consistently enough to get through any one zone without losing a couple of

buggies. Although the sprites are fairly unexciting, they zoom around the screen quite

energetically, and by the time you've progressed through WW1, WW2 and Korea you'll have to concentrate very hard

A few little extras like a reading machine of Hoover's 5th and an original form of high-score table make **Battle Through Time** just that little bit better, but it would have been nice to see the effort put into a more original game.

Program: Battle Through Time, 64
Supplier: Androg
Price: £7.95
Graphics: ★★★★★
Sound: ★★★★★
 Gameplay: ★★★★★

Darkest Africa

This is the type of game the likes of which I would like to see more of, he said ungrammatically. It combines arcade and adventure features, so you get all the interest of interacting with the computer without the tedium of reading rooms of text describing the usual Gordin's Dungeon.

Like a traditional adventure,

each scene is described in a few lines of text at the top of the screen, and on the bottom is the interactive section where

your input comes up. The graphics section in the middle shows your main character, Dr

Livingstone, who can be controlled by a joystick and typed inputs of the usual minimum type. The animation is very well thought out — Livingstone even blinks and nods his head on cue.

The usual kind of adventure problem comes up — how do you get the canoe's paddle, which has a snake on it? How do you choose which native guide to recruit? And how do you get in the night? It's easy to fall into the various traps — no light and the animals get

you — and on your quest for the lost Kenya Diamond there are plenty of dangers. With its fascinating combination of ideas and relatively original theme, **African Safari** has a good deal to offer all games players. Mind the crocodiles, don't get you.

The answer to your pro

That's one answer, here's a more practical one — BREDEN'S BASIC

Much as we all love the Commodore 64 for playing games or running our business software on, when it comes down to the very gritty of learning more about the computer and doing some programming, there is much room for improvement.

That is why we created **BREDEN'S BASIC** — it may not be the only extended basic around, but after reading the following information we are sure it is the only one you'll buy

BREDEN'S BASIC — the Essential Extended Basic for the Commodore 64 incorporating High Resolution Colour Graphics, Structured Programming Techniques, Multi-Colour Graphics, User Defined Character Graphics, Mouse and Joystick Software and Toolkit Facilities plus many other useful features.

BREDEN'S BASIC has some comments, 128 in all, for the programmer to use than any other Commodore Basic currently available, and drives the Sound and Graphic chips to their fullest extent (most of writing in Machine Code.

Whirly-birds

Zaga Mission looks very much like Dynamix's much-praised *Heros*, having the same angled perspective and complex maze-like structure.

You have to pilot a highly manoeuvrable helicopter through a maze of walls and buildings, in order to reach an underground power plant to carry out vital repairs. You can choose two types of control: normal, in which moving the joystick up moves the chopper up, or pilot, in which it moves

it down as it would on a real helicopter. Left and right

carefully using the helicopter's shades and a bright gauge,

control is obvious, and the fire button controls forward speed. Height has to be judged very

otherwise you'll find yourself smashing into walls which you thought were floors, or vice-

versa. Perspective in this game is very hard to judge, though I'm not sure if this is deliberate or not.

There's a fuel limit, of course, so you have to land every so often to tank up. Apart from that there isn't a great deal of tension, and *Zaga Mission* is probably more suitable for those game players who enjoy a program just because it's difficult to master, rather than being fancy about the originality or brilliance of the program.

Program: Zaga Mission, 64
Supplier: Astrig
Price: £7.95 (normal), £9.95 (del)
Graphics: ★★★★★
Sound: ★★★★★
Gameplay: ★★★★★

Lost cargh

You've seen the movies, you've read the books, you've bought the power magazines and the T-shirt, now play the game. It's unfortunate that this spin-off is inevitably disappointing — it's as if the producers think that they've put enough hard work into negotiating for the game

rights, and they shouldn't have to make any effort towards writing the game.

There are six screens with fair animated graphics, although the sprites are monochrome and the collision detection doesn't seem very precise. Your little Indiana Jones scurries all over the screen in search of lost treasures, threatened by nippy monsters. Some of the logical thinking puzzles

were evidently beyond my poor mentality, since I spent ten

minutes on one screen with absolutely nothing happening.

Still, I expect the game will sell well, since the packaging is attractive and more polished (and thus more) will probably find a good game or struggle to get out inside.

Programming problems?

- Each command fully explained with example and explanation.
- Allows control of up to two joysticks or 4 paddles.
- Automatic light pen co-ordinate scaling.
- SPRITES and GELCS may be SAVED or LOADED directly from tape or disc. The same is true of HI-RES GRAPHIC.
- Makes obsolete the need to calculate RAM addresses for any graphic commands.
- BREDEN'S BASIC comes with a 300pp easy to use manual plus disc and cassette in a presentation box.
- Less than £2 BREDEN'S BASIC allows plenty of room for program development.

BREDEN'S BASIC COPYTEXT

Great value for money at £29.95, a higher degree of versatility and tremendous user friendliness. All in one easy to use package.

CLIFF HANGER

AUTHOR - JAMES DAY ORIGINAL MUSIC - BRIAN DOE

Thrill to the cartoon style action of Cliff Hanger, a really original, Wild West game. As Cliff the hero, you've got to stop the bandits shooting up the canyon. But with its own brand of wacky cartoon action fun, things simply aren't as they seem in Cliff Hanger. For a start, the boulder you throw at the ol' bandits may just come bouncing back at you.

Cliff Hanger incorporates all the elements that have made New Generation games best sellers for the Spectrum, such as original ideas, superb graphics and hilarious happenings - but now it's available first for the Commodore 64.

Featuring 50 separate screens, three levels of difficulty, one or two players scoring, Hall of fame and joystick compatibility or user defined keys, Cliff Hanger is set to be THE Commodore game playing sensation. Available from any good software store for just £7.95.

AVAILABLE

Shoot the Rapids

AUTHOR - PAUL BLUNN

Ever wondered what it would be like to face the ferocious white water in a top class canoeists slalom run? Well wonder no more because you can enjoy the fast action thrill of competitive canoeing from the comfort of your own armchair with Shoot the Rapids.

It's a game that involves real skill because you must move your joystick to simulate paddling action. You must get through the gates of the slalom course in the fastest time possible, while avoiding the river bank and rocks. There are also extra hazards like rogue speed boats and interfering beavers to worry about.

This multi-level game features increasingly difficult river courses with superb graphics and smooth scrolling along the river. Qualifying times have to be reached to move onto the next course.

With Hall of Fame, one or two player scoring and joystick compatibility, Shoot the Rapids is probably the best sports action simulation game devised to date. Available from any good software store for just £7.95.

SOFT★HITS

Diplomatic corpse

Choplifer was a great success in America, which says a good deal about the Americans. The scenario is quite promising: you control a heavily armed helicopter, which takes off from a pre-ordained outpost and heads into enemy territory to occur kidnaped diplomats.

The diplomats have broken out of their barracks and are milling around on the ground,

being threatened by enemy tanks. You can bomb the tanks, land quickly, load up with 16 diplomats and take them home, then start out again.

Hazards include missile-launching aircraft, the aforementioned tanks, and aerial mines.

Having rescued one lot of diplomats, you have to blow open the next barracks and get the next lot. The tanks will assault more frantically and the aircraft swoop menacingly, but there's something missing from the whole thing — the sound effects are pathetic, for

a start, have you ever heard an exploding helicopter going "blowup"? The vehicles aren't particularly well animated though the little ones

swirl around colorfully, and wait to see as they disembark.

The game's shortcomings

can probably be put down to its being somewhat long in the tooth, like several of the Arcade offerings. Still, it's very playable, and though it's no knockout visually, unlike for instance Virgin's Falcon Patrol 2 (which is a similar game in many ways), Choplifer will probably please a lot of games players.

Not enough thrust

Software Projects has been responsible for a good deal of excellent stuff, notably the seminal *Maze Runner*. It's difficult, then, to know what to make of this one, since it's simply a perfectly adequate little game of the type you might have expected Microscopic to put out before they went up-market.

You control a cute multi-sectored space probe which must move around a cavern destroying alien eggs and the vicious Guardians. Your level-powered lasers aren't good

enough to zap the alien themselves, so to knock them off you must wedge boulders off promontories and crash the little devils. Once you've

rapped all the guards and crushed all the aliens, preferably before they hatch out and make your life difficult by flying around the cavern, it's

on to the next screen, which is slightly faster and features different aliens and guards, although the basic layout is the same.

The no-idea how many levels there are, since the game doesn't hold the interest long enough to find out, but there are some nice sound effects. I wouldn't object if someone gave me a copy, but it's not the kind of thing I'd want to rush out and buy, considering that the world might end at any minute and there must be better things to do.

Titanic

There's an *It's Not Easy Bein' a Hero's* "Club of the ...", perhaps, since this game features many of the characters of Greek myth and legend which crop up in the film. It's an unusual-looking game, reminiscent of some of the Atari video-game cartridges, with large stylized characters and good colours.

You control Prometheus,

mounted on the winged horse Pegasus, in his attempt to reach the temple and speak

with the Oracle. As you zoom through the skies over mythic temples, open seas and

monster-haunted coastlands, harpies, Gorgons, fiends and cyclops try to zap you. Luckily you thought to equip yourself with a trusty Cosmic Lance before leaving home.

A great deal of dodging and zapping ensues, with smoothly-scrolling landscapes and some nice effects, especially the Bouncing Power Orb which can replenish your energy if you're cautious with them. Walking monsters require more effort to kill, and once

you've zapped the lot and got through to the temple your problems aren't over — you have to climb the temple stairs avoiding rolling boulders to get to the Oracle.

Good fun, though nothing overwhelming.

Wheelies

I can't quite follow the logic behind this one. I'd have thought that people are either interested in zooming around on their BMX bikes or in staying at home and playing with their computers. I wouldn't have thought the two

mixed, and so I can't believe that Hyper Biker will have much of an audience.

Still, it's a competent program, a sort of *Demolition on wheels*, in which one or two players can pump their BMX bikes along, racing against the clock and competing in sprint, obstacle and jump events. You can do wheelies by hitting the

left button, and I'm told that it's all very realistic —

especially when you fall off. I don't know, I'm over 13. Real BMX workers, as they say.

Learn new skills for home and business

Mike Grece uses his Brainpower to find new uses for your micro

I'D WISH this didn't happen to you, but I will find, even today, that my non-computer friends gaze with a mixture of awe and disbelief at my micro-sitting quietly on my desk, screen flickering with a few paragraphs of text or a bar chart, or an entire day's latest game. "Yes," they ask, "it's all very well — but what does it do?"

For a year or so after buying my first computer, the Vic 20 which still works amazingly for my children, I fantasized the dream that a computer did many wonderful things for me — and I hunted for software that would prove it. Often I came away disillusioned, since I had to come to terms with the reality that a pencil and paper tool often a calculator did things much quicker and easier.

Then came the word processor and spreadsheets and the database (I had now moved up to a Commodore 64) and at last it seemed my micro began to prove itself. Accounts could be added and changed quickly, addresses printed out, and so for the word processor — well, for a writer there's no comparison. But I was still haunted by the realization that most people don't want to do these things anyway.

Learning

I was finally coming to terms with the fact that my computer was just more fun for me — that I didn't have to justify buying and using it — when I chanced upon some new software by a company called Tripsych Publishing which has made me think again. As fast it seems that someone is producing something that will be of value for people who still aren't sure what they can use their computer for. At last I may be able to look at my non-computer friends and when they ask me what it's for — I'll be able to show them.

Tripsych created a series of titles based on business concepts but aimed at the home user; the three titles I brought were definitely slanted more for the business user, but other titles like *Star Watcher* and *Numbers at Work* suggest a more educational bias.

The basis of each program is a mix of learning (using traditional question and answer techniques which the computer will correct and score) and applications which you can use in your own situation. Thus you get the best of both worlds, and in my own case all three programs followed a similar pattern of a teaching section and an applications program which I could refer to for my own use.

The three programs I tried were *Project Planner*, *Forecast* and *Entrepreneur*. To be fair to all three I should point out that to

get full value it would be better for me to write the review in a year's time, as they all lend themselves to in-depth study (unlike most software around), but if you take this report as a preliminary one then you will be able to judge my findings more fairly.

They were all neatly-packaged in the familiar large moulded plastic box with inserts for cassette or disk plus manual. Each box has a descriptive cover showing the outline of a head and an appropriate word inside (graph for the business user, crystal ball for the forecaster, etc.) which shows that some thought about image and message has been taken. Below each picture is the title "BRAINPOWER — A PPLICATION THROUGH LEARNING". As I opened the first one I had no idea how accurate that title would prove to be.

Forecaster is a system of forecasting or predicting the outcome of events such as future sales, share prices, and so on. It is also a method of analyzing the various factors that can mean the difference between success or failure in a project.

Being computer-based the program goes heavily into the quantitative methods of prediction (this means it uses facts, statistics and numbers rather than opinions) and very quickly you are learning about things like time series, causal models and exponential smoothing. These were all concepts completely new to me, and it was gratifying to realize that I was picking it up fairly easily, which is more a reflection on the standard of teaching than my own ability.

The learning process is similar for each *Brainpower* program. You are provided with a manual containing well-presented examples and explanations, and a program

(on tape or disk) which you load into the computer and which you use at the same time. So, for example, the manual talks about a scatter graph and the computer will draw a sample on the screen. The idea works well, being suited to the medium. At the end of most chapters there is a short exercise to test your understanding, and if you get below a certain percentage of marks a message "PERHAPS YOU SHOULD READ THIS CHAPTER AGAIN" acts as a kind reminder.

I found the theories of prediction fascinating and was soon fairly expert at five point moving averages, Holt's method of double exponential smoothing and classical decomposition (the names conjure up quite graphic ideas if you didn't know we were talking about forecasting, don't they?). One point that is possibly due to early release was that I found some mathematical errors in the sections on Holt's Method (pages 22-23 in the manual) but these should be corrected in later versions of the program.

Having mastered the theory we can move on to produce our own forecasts using the applications program. Here the computer asks you to complete the data and then it gives you a kind of answer for some time (the manual even tells you to go and have a cup of tea) while it does all the complicated sums. Finally the result comes up giving you an idea of the predictions without having to do all the complex mathematics yourself.

Being a newcomer I didn't have the opportunity to try this out myself properly, but I had a go and was rather disappointed when the program kept telling me to use a MATRIN SINGULAR method on my example, as I have no idea what a matrix singular is and could find no mention in the glossary or index. Perhaps the mystery will solve itself on a further reading, but at the moment it remains shrouded in the depths of the 64 bits far above resident in the new edition — *Ed.*

Planner

The next program is *Project Planner* which seems more fun and is definitely easier to learn. *Project Planner* teaches you how to break tasks, problems, any situation into "single meaningful components" (as the blurb on the package says) and is really all about organizing your work. To the ordinary chap this might seem to be stating the obvious, but not so.

Take any task the manual describes someone sitting up a shop) and it can be divided into various jobs that you need to do (such as finding the premises, hiring staff, stocking up, etc.). Now while all

these are obvious, often the best way of carrying out these tasks is not. Finding the most efficient method in the shortest time is the secret so that you can minimize effort yet maximize efficiency. For example if we think of stocking our shop, it would cost more money if it was done too soon (tying up capital and increasing interest at the bank) but would lose sales if done too late.

So it becomes important to know exactly when to stock the shop, what is the best time you can do it, and what procedures are essential to ensure a smooth ride. And it isn't just in the field of business this applies, for you could be organizing a school fête, planning the education of your children, building an extension on your house, etc.

The manual leads us through the prerequisites, network planning and critical path analysis towards such generic concepts as free and interlocking floats, once again with a simplicity that I found endearing. One aspect in this package is that the actual programming is better, (for example you can leave the program by pressing a key without having to turn the computer off), and the layout and screen colouring seemed better than in Forecast.

Applications

Moving to the applications package the procedure is the same. Once again you enter the data and the computer does all the sums. I found the report-printing a little dodgy on my Gemini 10X (possibly an interface based) as I couldn't print out the bar chart, but I was able to make a print-out of a network which I set up for running a conference. If you haven't worked through the teaching section some sections would be a little hard to understand and it's a shame that on the 64 you can't print out some nice graphics (as in the manual illustrated in Figure 7) but perhaps I mean less much for my money.

Finally for this article we come to

Entrepreneur — the ideal program for the process starting up their own business.

This is the most comprehensive package of the three I've seen, and really lends itself to a full review. The manual covers items such as VAT, the legality of business, the benefits of a partnership versus a Limited Company, tax advice and many other items of information essential to anyone seriously thinking of setting up any business — however small. Although this information is available elsewhere it is really easy to get to grips and understand all you need to know in the few well-presented pages in the manual.

Chapter 2 alone on Planning a Business is worth far more than the cost of the whole package, as there are 14 pages of questions you have to answer (and that means think about) concerning starting out. I found the depth of this section surprising for such a small book (and I've read a few others on starting a business) and after working through it all myself I had encountered several facts about my own enterprises which I hadn't considered before. It takes talent to write so concisely yet with depth

and understanding.

The manual then moves on to discuss assets and liabilities, equity and profit, and topics such as the importance of correct cashflow. I found the explanations simple to understand, and as before the programming enhances the words. As with the other manuals simple case histories are included to clarify the concepts.

Finally there is an applications program into which you load all the information about your proposed business for your existing one) and let the 64 do all the work. Up come the assets and liabilities and the balance sheet figures are presented for you to study. But you do need to know all your facts first.

This package is visually not so spectacular as the other two (especially the computer examples) but it seems to have a much more direct application to the small business. And come to think of it — the large business as well!

So, in conclusion, what do I think of *Entrepreneur*? As I said earlier, you also need to use your brain — quite a lot. The subject matter is substantial and if you're going to gain anything from the application packages you need to have done your homework first. But, in my opinion, that is one of the strengths of this series of software.

Computers aren't toys (despite the adverts which often try to tell you so) — they're amazingly powerful tools which should be helping us in our daily lives. It's a moot point whether critical path analysis and statistical information is the stuff of everyday life — but then again why not?

Capacity

The great strength of these programs is the time and effort that's gone into making quite complex ideas seem easy — and that does take skill. At £19.95 a program for the tape version and £24.95 for the disk version it compares very favourably in value with the high-priced software for small business users. But it isn't what it costs that should matter — it's what it's worth.

I've a few niggles, but they are slight. The most ones I found was the mathematical mistakes I've already mentioned in Forecast, though Triplex promises to correct these in future editions. Other mistakes inevitably creep in, some involving very slight errors in the manual (such as calling the cursor a white box when it's black) which are I suspect proof-reading errors in the conversion from one computer to the next. The explanations both on screen and in the manual are excellent for the first-time user.

These are well-produced items of software which succeed in being different and stretch the capacity of the machine — and (quite significantly) the user, you and me. That is where the *Entrepreneur* series shines; it treats us as adults who really want to acquire knowledge that we can apply out of our computers.

You won't find these programs a few more minutes with your micro. You will find, if you use the time and effort into using them properly, that you have a tool that will teach you a lot and help you control your environment. ■

Double or quits — the micro gamble

A report on the Las Vegas Consumer Electronics Show by Chris Jenkies — where the C16 and Plus/4 have lost, can the C128 and LCD turn the trick for Commodore?

EACH YEAR the Winter Consumer Electronics Show is held in Las Vegas, and the Summer show in Chicago. Traditionally, the shows are a chance for the major computer manufacturers to preview their wares, both to excite media interest and to assess the reaction from software manufacturers and dealers.

Monopoly

Commodore's enormous Las Vegas stand emphasized once again the company's importance in the small computer field, but, despite the usual confident press statements, things were not looking good for two of the latest products, the C16 and the Plus/4.

Not one independent software manufacturer was showing programs for the C16 or Plus/4. The Plus/4 has not been marketed at all in the U.S., perhaps because IBM and Apple have monopolized the "serious applications" market to such an extent that the limited Plus/4 couldn't attract buyers. The C16, touted as a "first computer", has had a limited degree of success, but apparently has suffered in

comparison with the cut-price Atari machines.

The future of the Plus/4 and the C16 now looks dubious, despite the C16's relative success in the UK over Christmas. Commodore's US marketing manager, Frank Leonard, commented that the machines would have to be "repositioned in the market" — perhaps a euphemism for being discontinued.

The Commodore 64, meanwhile, remains the flagship of the Commodore line. A price cut to around \$149 is on the way — a further indication that the C16 is not thought to be worth supporting — and there was a good deal of software support evident from companies large and small.

Exciting

The big news, however, is the launch of two new and exciting Commodore personal computers, the C128 and the lap-held LCD.

The C128, if it comes into production in the form previewed at the show, is certainly Commodore's most exciting product yet. It operates in three modes which make it

ideal for games, small business and fully professional applications.

The first mode, CM, is fully compatible with the Commodore 64. All 64 software and hardware can be used, a feature which guarantees that C128 users will have an enormous base of usable software as soon as they purchase the machine. It's the first time Commodore has introduced a micro which is "back-compatible" with a previous product, and it's a move which should protect the future of the Commodore 64 for some time to come.

In C128 mode, the machine runs a new version of Basic, T.O., which has over 140 commands, statements, and functions, including all those from the CBMM and the C16-Plus/4. The 128K RAM is expandable to 512K using an external RAM disk option. The 8501 processor used in C128 mode is a compatible variant of the 8502, which features 48K ROM.

An exciting extra for word processor users is the addition of switchable display modes: 40 columns by 25 lines or 80 columns by 25 lines.

For business users, the third operational mode of the C128 is the most exciting of all, CP/M mode.

CP/M, one of the most popular business operating systems, runs a Z80 processor like that found in the Sinclair Spectrum and many other non-Commodore computers. It's not new technology, but it's new to Commodore users. The Commodore CP/M mode supports the optional CP/M fast disk drive operating system.

Inspired

Taken as a whole, the C128 seems an inspired design which can perform as all things to all men. It protects the future of the 64 and its millions of users, offers the possibilities of much more powerful programs and an even better Basic, and has a great deal to offer the serious user — much more so than the ill-conceived Plus/4. As a direct competitor to the IBM and Apple personal computers, the C128 could be a winner if it offers value for money — though no-one would be foolish enough to put an estimate on its retail price yet. It's due for release in the

spring, as is the flip-tilt LCD.

The LCD is a portable designed for on-site use in a number of applications; word processing, calculation, data storage, memos/notes, and communications through the built-in 800 baud modem. There are eight built-in software packages and a flip-up 80 x 16 LCD display. The processor is an 85C102, running Basic 3.8 with full compatibility with all Commodore 64 serial peripherals — so you could, for instance, type a report on the train then print it on back in the office. Aimed to compete with machines like the Radio Shack (Easy) 100, Epson FX-8 and NEC PC801A, the LCD will certainly find a market if the software is stimulating.

The new 1171 3 1/4 inch disk drive is compatible with both new machines and the 64, and has a storage capacity of 100K. It incorporates CP/M routines and its own 6502 processor with 12K ROM and 2K RAM. Data transfer rates vary between machines — 500 cps with the 64, 1200 with the 128 and 2500 under CP/M control.

There was no sign at the CES of production models of the 16-bit 128PC compatible computer, but a privileged few were shown an advanced version of the machine in private. There are still no firm release dates, but Commodore hopes to show a version in the UK soon. Again, no further details on the Amiga Lorraine emerged, but Commodore repeated claims that the machine was on schedule.

NEW COMMODORE PERIPHERALS

1171 DISK DRIVE: 3 1/4 inch single disk drive with 100K storage, 6502 processor with 2K RAM, 12K ROM, transfer rates from 500 to 2500 cps. Compatible with C128/64, C128, LCD, C128 RGB-COMPOSITE COLOUR MONITOR: RGB mode, 80 characters by 25 rows, 200 total characters, 3 x 7 matrix; composite mode, 40 by 25, 1000 characters, 6 x 7 matrix, 13 inch screen, brightness, contrast, volume and horizontal position controls, C128A, C128 compatible.

1171 RGB PRINTER: 18 directional 6 x 6 dot matrix printer, full PET graphic characters, memos and controls, tractor feed, 60 cps, 80 column width, true daisywheel.

COMMODORE 1100/90: Inexpensive drive similar to that on the Apple Macintosh. Uses a rolling ball on the underside of the unit, together with a number of operation buttons, in conjunction with icon-driven software.

COMMODORE LCD PORTABLE COMPUTER

GENERAL FEATURES • Built-in applications software • Built-in 800 baud modem for telecommunications • Runs on batteries or external power • Automatic power down that saves battery life

BUILT IN SOFTWARE • Wordprocessing • Scheduler • BASIC • File Manager • Calculator • Memo • Spreadsheet • Memo • Post • Address Books • Terminal Emulator

SYSTEM FEATURES • 85C102 CMOS microprocessor (1MHz) • 12K CMOS RAM • 94K CMOS ROM • Built-in BASIC 3.8 • Built-in system utilities

DISPLAY • 80 x 16 Liquid Crystal Display • 480 x 128 resolution graphics mode • Upper and lower case characters

KEYBOARD • Typewriter style • 72 keys • 8 programmable function keys • 4 cursor keys

INPUTS / OUTPUTS • Serial 1 / 0 Port • RS-232C • Centronics parallel port • Modular phone jacks for direct connect modems • Expansion port • Bar code reader port (Hewlett/Packard compatible)

RECOMMENDED PERIPHERALS • 1141 or 1171 single disk drive • MPS 802 or MPS 803 printers • All Commodore serial peripherals are compatible

DIMENSIONS • 11.7" x 10.5" x 11.7" (H x W x D)

WEIGHT • 1lb. 4oz.

POWER • 1.5A NiCad battery (15 power hours) • 500 Milliwatts • NiCad battery backup • A-C adapter included

OTHER • Light beige

VIZASTAR 64

THE INFORMATION PROCESSOR

■ Spreadsheet

■ Database

■ Graphics

■ Extract from your information files and include them into the worksheet for fast, precise calculations and easy reporting.

■ Instant on-screen design of your information records.

■ One word menu lists for easy selection of facilities.

■ The high resolution graphics screen for resolution printing or easy on-screen display.

■ A 1000-row by 64 Column wide worksheet with large memory capacity and efficient usage.

■ Extensive use of 'Windows' allows you to view one part of the worksheet while working on another.

■ Add or remove items from your records without having to re-construct your existing information records.

■ Recording in 1,000 characters long with maximum up-to-100 characters.

■ Supports virtually any printer: **CRJL, EPSON, JCL, BROTHER, OLIVETTI** and many others.

■ Parallel printers require **ONLY** a low-cost cable.

■ Include information directly onto the Worksheet from **VizWrite** and almost any other system.

■ Simultaneous display of worksheet and text or bar graphs.

■ Advanced spreadsheet features include individually variable column widths, protected cells, a programmatically placed wide range of in-built functions.

■ Worksheet manipulation features you desire: **Sort, Copy, Move, Delete** and **Insert** by row, column or a range.

■ Fine editing facilities for letters, invoices, report headings etc.

Vizastar integrates three important electronic aids to your business or home office.

A fast and easy-to-use package - Vizastar is a comprehensive information processor that includes an electronic worksheet, information filing system and simultaneous on-screen graphics.

Vizastar has been designed to incorporate the very latest in user-friendliness - so now you can handle your all-important information in many new ways and in a quick and effective manner.

The information filing capabilities of Vizastar enable you to store your information onto disk in

an ordered and instantly retrievable form. This means that you can quickly pick out individual or entire groups of related information to create lists, statements, labels or reports.

Vizastar is the **ONLY** program of its kind on the Commodore 64. Completely consistent with the VizWrite word processor, Vizastar provides a totally comprehensive office system.

Vizastar costs just **£89.95 (incl. VAT)** from your computer dealer and selected stores. Please write for more details and the name and address of your nearest dealer.

COMMODORE 128 PERSONAL COMPUTER

GENERAL FEATURES • Revised styling • 100% compatible with Commodore 64 • Built-in, easy to use DOS support • RAM expandable up to 512K RAM using RAM disk option • Upper and lower case character set • Built-in BASIC • 3 separate modes of operation

64 MODE • 6310 compatible microprocessor (1.0MHz) • 6545 sound interface chip • 64K RAM • 16K ROM • BASIC 2.0 • 40 x 25 lines (320 x 200 resolution) • 16 colours + 8 sprites

16 MODE • 8000 microprocessor (1 or 2 MHz) (64K compatible) • 6541 sound interface chip • 128K RAM (expandable to 512K using RAM disk option) • 48K ROM • 16K ROM for DOS support • BASIC 7.0 • machine language monitor • 40 x 25 lines (320 x 200 resolution) • 60 x 25 lines (640 x 200 resolution) • 16 colours + 8 sprites (40 column only)

CP/M MODE • Z80A microprocessor (6MHz) • CP/M™ Plus version 3.0 • 128K RAM (expandable to 512K using RAM disk option) • 40 x 25 lines (320 x 200 resolution) • 60 x 25 lines (640 x 200 resolution) • 16 colours

KEYBOARD • Full size operator style • 92 keys • 64 key numeric keypad • 8 programmable function keys • 6 Cursor keys • help key • 40/80 column key • No scroll • line feed • Escape • Tab • Cap Lock • Alt

INPUTS/OUTPUTS • User port • Serial port • Cassette port • 2 Game ports • RF/TV port • Cartridge port • Audio input • Audio output • Composite Video • Digital RGB video

RECOMMENDED PERIPHERALS • MPS 802 or MPS 803 printer • 1571 single disk drive • 1801 monochrome monitor • 1802 digital RGB colour monitor • 1660 and 1670 modems • Fully compatible with Commodore 64 software and accessories

DIMENSIONS • 36cm x 40cm x 32cm (H x W x D)

WEIGHT • 6lbs. 6oz.

COLOR • Light beige

COMMODORE 1571 DISK DRIVE

GENERAL FEATURES • 5 $\frac{1}{4}$ " floppy disk drive • Supports fast data transfer rates • Two serial ports for adding peripherals • Software disk format selectable • Comes with serial and power cables • Compatible with Commodore 128, 64, Plus/4 and LCD computers

SYSTEM FEATURES • Built-in 6502 microprocessor • 2K RAM • 12K ROM • Built-in DDD • High data transfer rates • 800 cps under C64 control • 1500 cps under C128 control • 1500 cps under CP/M control • Up to 6000 cps burst rate

MEDIA CHARACTERISTICS • Commodore Standard DDD • Double sided/single density • 150K storage capacity (formatted) • Compatible with 1541 and 2001 disk drives • Supports program, sequential, relative and user files • CP/M compatible (44PM) • Double sided/double density • Up to 400K storage capacity (formatted) • Boots up in IBM™ System 34 format (Support™ and Osborne™ format compatible) • Supports most CP/M™ files

INPUTS/OUTPUTS • Two serial ports • Power connector: 150004095 • 5mm x 21mm • 34mm (H x W x D)

WEIGHT • 6lbs. 12oz.

COLOR • Light beige

PROGRAMMERS

WE ARE LOOKING FOR TOP QUALITY PROGRAMMES TO MARKET IN THE UK AND ABROAD. THE PROGRAMMES MUST BE OF TOP QUALITY AND IN MACHINE CODE WITH GOOD GRAPHICS AND SOUNDS AND ORIGINAL CONCEPT. WE ARE LOOKING FOR PROGRAMMERS TO CARRY OUT WORK ON NEW MACHINES SUCH AS THE C.B.M/16 AMSTRAD AND M.S.X. WE CAN SUPPLY THESE MACHINES TO CARRY OUT WORK FOR MIRAGE. WE ARE ALSO OFFERING £500 PRIZE FOR THE BEST PROGRAMME RECEIVED BY THE END OF FEBRUARY 1985 WHICH WE WILL DECIDE TO MARKET. WE OFFER AN OUT RIGHT PAYMENT OR 10% PLUS PAYMENT OR 20% ROYALTIES. FOR MORE INFORMATION CONTACT THE SOFTWARE MANAGER HE WILL BE GLAD TO LISTEN TO ANY QUESTIONS YOU MAY HAVE.

SOFTWARE HOUSES

WE ARE LOOKING FOR TOP SELLING PROGRAMMES TO DISTRIBUTE TO OUR WIDE RANGE OF OUTLETS THROUGHOUT THE UK AND GIVE YOU A VERY FAST SERVICE TO HELP WITH YOUR SALES AND TO MAKE THE MOST OF YOUR PRODUCTS. SEND A SAMPLE COPY OF YOUR PRODUCTS WITH RATES AND TERMS FOR A FAST ASSESSMENT. FOR MORE INFORMATION CONTACT THE SALES MANAGER HE WILL BE GLAD TO HELP AND ASSIST YOU.

DEALERS AND DISTRIBUTERS

DEALERS WE HAVE THE BEST SELLERS FROM THE BEST PRODUCERS; WE ALSO OFFER VERY GOOD RATES AND TERMS TO HELP YOU AND US TO ACHIEVE THE BEST SALES AND SERVICE. FOR MORE INFORMATION CONTACT THE SALES MANAGER.

DISTRIBUTERS HAVE YOU GOT THE MIRAGE RANGE ON YOUR SHELVES. IF NOT THEN CONTACT THE SALES OFFICE FOR SAMPLES AND RATES.

The Vic 20's mind at work

An extract from *Raeve West's definitive guide to Programming the Vic*, looking at the micro's memory map

THE VIC-20's memory map represents the arrangement of memory as it is seen by — in other words, connected electrically to — the 6502 chip which performs most of VIC-20's computing. Generally, this article uses the phrase memory map to refer to the 6502's map. However, note that every chip which can address memory has its own individual memory map. The VIC chip itself has another less complex memory map which is treated in understanding graphics.

The 6502 uses 16-bit addressing and can access 2¹⁶ = 65536 memory locations. As already noted, these are conventionally numbered 0 to 65535 (or, in hexadecimal notation, from 00 to \$FFFF).

The memory map shown in Figure 1 is divided into 16 equal 4K blocks (4K = 4096 = 4096 bytes; this is \$1000 in hex). This is a convenient subdivision. Conceptually, each block can be further subdivided into pages of 156 bytes each, with the zero page at 00-1FF, page 1 at 00180-001FF, page 2 at 00200-002FF, and so on. This is important because the 6502 treats pages 0 and 1 as special cases.

Figure 1

Here's an explanation of the map:

RAM from 00000 to 000FF (\$0-0023). This 1K block of RAM is necessary to run BASIC and has many functions, described later.

RAM from 01000 to 010FF (\$000-\$010). BASIC programs have to be stored in a single continuous area of memory, so BASIC is stored here in the unexpanded VIC. The screen is also stored in 512 bytes in this region. The screen normally starts at \$1400 in this configuration (unless moved), so BASIC has only 4096-512 = 3584 bytes available.

ROM from 08000 to 08FFF (\$7000-\$70FF). The VIC character sets are stored here. There are 128 characters in the uppercase — graphics set and 128 characters in lower — alphanumeric set; moreover, each is duplicated in reverse. Each character definition requires eight bytes (64 bits) so the total amount of memory required for character definitions is 128*2*256 = 4096 bytes.

Input — Output chips occupy a total of 4K bytes. The VIC chip uses 00000-0000F, VIA 1 uses 00100-0011F, and VIA 2 uses 00200-0021F.

RAM from 09400 to 097FF (\$7000-\$70FF). This is video RAM, determining the color and type of character on the screen. Only the lowest four bits of each byte in this area are significant.

ROM from 0C000 to 0CFFF (\$A000-\$A0FF). BASIC and the computer's operating system are stored here. The kernel ROM holds all the information needed for the computer to interface with the outside world, for instance through the screen and keyboard.

One drawback of the unexpanded VIC-20 is its tiny memory. VIC comes with RAM from 0 to 000FF and with 4K of RAM for BASIC from 01000 to 010FF. Because of this, the unexpanded VIC is sometimes called the 8K VIC. However, when the screen has taken its 512 bytes from BASIC's 4096 bytes, only about 2500 bytes remain.

Memory expansion is essential for serious programming with the VIC-20.

One drawback of the unexpanded VIC-20 is its tiny memory. VIC comes with RAM from 0 to 000FF and with 4K of RAM for BASIC from 01000 to 010FF. Because of this, the unexpanded VIC is sometimes called the 8K VIC. However, when the screen has taken its 512 bytes from BASIC's 4096 bytes, only about 2500 bytes remain.

Memory expansion is essential for serious programming with the VIC-20.

\$A000-\$BFFF. This is the most precious location for ROM cartridges: almost all cartridge games load here. In addition, if the proper bytes are present starting at \$A000, programs here will automatically begin to run when the VIC is turned on.

Reconfigured

As its memory is expanded, the VIC-20 reconfigures itself in several ways. Thus, programs written for the unexpanded VIC may not work when memory is added, even though there is clearly no lack of memory space available. For the moment, attention will focus on the unexpanded VIC, returning later to examine memory expansion in depth.

It is possible to use BASIC to FREE all locations from 0 to 01000. In a sense, this would provide you with a memory map. But it would be relatively meaningless without some further distinctions.

However, the VIC cannot be expanded simply by inserting RAM chips into sockets inside the machine. Cartridges have to be used, those are simple to use but far more expensive than their component chips.

There are four existing sections of the memory map, each with particular characteristics.

\$0000-\$00FF. This 1K space can be occupied by RAM or ROM; RAM is usual, and both the 1K RAM expander and the Super Expander cartridge put RAM here.

Program 1

```

0 DATA 32,119,0,240,37,52,130,205,32,2,215,132,25

3 DATA 254,2,136,177,251,145,153,169,0,151,0,160,15
3,0
4 DATA 150,192,0,208,239,76,191,134
10 FOR J=0 TO 255:PRINT:GOTO 1,NEXT J,NEXT

```

BASIC can now occupy an extra 1K. **\$0000-\$00FF.** This large area can be occupied by RAM, ROM, or by a combination of the two. Commodore's 8K RAM expander can be set to occupy any of those blocks; the 16K expander normally puts RAM from 02000 to 02FFF. BASIC can fill whatever extra RAM follows from 01000 on. Thus, an 8K expander set to occupy 00000-000FF adds 8K for ML or data storage, but doesn't normally add to BASIC's free memory.

\$0000-\$00FF. This 2K area is the old

Program 1, which works with any VIC-20 regardless of memory configuration, shows you the contents of any section of VIC-20's memory up to 255 bytes long. With it you can select a portion of memory and display its contents in black on top of the screen. Set the display to lower-case mode by pressing \$H11FF and the Commodore logo-key. This program is a useful investigative tool, worth typing into your VIC and using far later on. It redisplay the selected portion of memory 60 times a second, giving for all practical

display a continuous picture of VIC's memory. Use RUN - STOP-RESTART to turn it off. Note that it will not operate while the cassette is in use, or with some cartridges.

Activate Program 1 with a statement of the form SYS EXP,N,Y where X is the starting address and Y is the number of bytes (see Figure 2).

The first example shows how the input buffer operates; nothing happens until RETURN is pressed, then an entire line is input and searched for reserved words. You can try BASIC being converted into one-byte tokens, and you can watch an inverted variable name like COPYVBRNINM have

because it has to be able to change to reflect the screen's organization; the high bit of the last character of each ROM keyboard icon, making this word appear in reverse on the screen. File tables, which hold details about each currently open file, are another example.

Buffers. A buffer is a section of RAM reserved for input or output. Buffers include the input buffer, the keyboard buffer, and the 182-byte tape buffer at \$B3C-\$B3F (\$C24-\$C2F), which is important when reading from and writing to tape.

Pointers. Zero page locations (0-255) contain many pointers in the form of a

function of VIC-20 to be modified. The memory examination program described earlier changes the vector to the routine which looks at the keyboard every sixth of a second. Sometimes ROM contains vectors; the Kernel itself is a good illustration. A jump table uses a similar approach, except that each address is preceded by an ML JMP instruction and therefore occupies three bytes instead of two.

Flags and temporary storage. These are programming equivalents of a joint-draw note, invariable in RAM. They keep track of a wide variety of events while programs run, ranging from whether the machine is in immediate mode to the position of the cursor on the screen.

Programs. Most of ROM is subdivided into the BASIC interpreter and the Kernel, a collection of many unincorporated machine language routines. The only substantial program outside ROM is CHRGAT, a routine at locations 874-88A (D11-D18) which loads individual BASIC characters. CHRGAT is copied out of ROM into RAM when the system is started on or reset. Having the routine in RAM is marginally faster than using a ROM routine; it also permits new BASIC keywords to be added to the original stock using a program called a wedge.

Accumulators. Several number storage areas exist in RAM: two floating-point accumulators, whose numbers are added, multiplied, and so on (\$61-66 and \$69-6E); a pseudorandom number storage area (\$6B-6E); and the routine clock (\$A0-\$A3). The memory examination program shows the three bytes of the clock changing, and PRINT PEEK(\$A0)*256 + PEEK(\$A1)*256 + PEEK(\$A2) is identical to PRINT T.

The stack. The stack can't really be understood without knowing machine language. Essentially, it is 256 bytes of RAM from \$180 to \$1FF (\$26-\$31) that are used by the 6502 microprocessor to store temporary information, particularly information relating to subroutines. It is normally low left alone. Short machine

Figure 2

SYS 828,11,80	(displays the input buffer, showing line input)
SYS 828,256,28	(displays numerals as they are formatted)
SYS 828,217,28	(shows the screen link table)
SYS 828,897,10,200	(displays some ROM keywords)
SYS 828,63,10	(shows the keyboard buffer)
SYS 828,203,1	(shows the horizontal position of the cursor)
SYS 828,0,220	(displays the entire zero page)
SYS 828,568,1,15	(shows the VIC chip contents)
SYS 828,1728,1,15	(shows the contents of a VEA chip)
SYS 828,146,3	(shows the locations which make up the VIC's clock)
SYS 828,100,100 + 256*PEEK(\$14),80	(shows how part of a BASIC program in memory is stored)

the reserved word found.

The next example shows numbers as they are stored before being printed. It is possible to write an ML program to re-format numbers before you like, for example with a zero before the decimal point or 0.0 rather than .0.

The third example shows a table which keeps track of the way VIC's 12-character lines are linked. Let the space bar repeat past the end of a few lines to watch the effect. Then scroll the screen and see the links move to match.

Buffer

Type in SYS 828,63,10 and press RETURN. A series of ten @ symbols should appear at the top left of the screen. Since this program PEEKs values directly to the screen, and since @ is the screen representation of a zero byte, this means the keyboard buffer is empty. To show how it operates, type the short program in—0 CRT \$L: PEEK @ = 0 TO 1000: NEXT: GOTO 0—and RUN it. The delay loop allows you to queue keypresses in the buffer, and you can see the later keypresses lining up after the earlier ones.

Don't worry if you don't completely understand the examples yet; all will become clear in due time.

To see how VIC's RAM is prepared for BASIC, you need to understand certain software structures. "Looking at Memory," the program you just typed in, can help, and later on we'll present a full memory map showing how software fits into the hardware framework of the VIC-20.

There are several types of software landmarks:

Tables. These contain data, not programs, and have invariable uses. The screen link table and ROM keywords, revealed by the previous programs, are typical. The screen table is in RAM,

pair of adjacent bytes. Information about the storage of BASIC is held in this manner. The pair of bytes forms an address in standard low-byte-high-byte format. For example, locations 83 and 84 are the pointer to the beginning of BASIC program storage. On the unexpanded VIC, the normal values held in these locations are 1 (\$01) and 86 (\$56), indicating that program storage starts at location 1 + (16*86) = 497 (\$30B).

Vectors. These resemble pointers, as they are also pairs of bytes that constitute addresses. However, while pointers merely hold address information, vectors are used to tell the computer where to find routines to perform certain important operations. Each vector is set up to point to a routine within BASIC or the Kernel operating system when the system is started on or reset. Allowing these values enables many

Figure 3

Table 1

Cartridge Only	RAM	BASIC	Bytes Free	Screen Start	Color RAM Start
Unexpanded VIC-20	\$1000-\$110FF	\$1000-\$110FF	3960	\$1000	\$0000

*No pack-out to \$1000-\$10FFF

8K pack-out to \$0000-\$1000

Note: "Bytes free" = total RAM available by BASIC, less 512 screen bytes (less 1 byte/line at the very end of BASIC).

language routines can be stored in the lower portion of the stack; if tape is in use, a safe starting location is \$0140.

We'll move on now to look at the expanded VIC-20.

The BASIC memory maps for the unexpanded VIC, and for the VIC with 8K, 8K, and 16K expansion, are shown in Figure 1.

It is helpful to look at the programming side of these expanders before seeing what can be done with simple hardware modifications. RAM expander combinations are listed in Table 1. They show start and end of RAM, start and end of BASIC program storage, bytes free, the start of the screen, and the start of color RAM. Color RAM positions is related to screen position.

Expander

Note that a 8K expander, if used together with another expander, is not used by BASIC (although it can be used to store machine language or data). This is the best the VIC-20 can do, since its chip design prevents it from putting the screen below location \$1000. Thus, the absolute maximum length of the BASIC program storage area is from \$1000 to \$1FFF, about 28,000 bytes. Also note that the Super Expander cartridge includes an additional 8K built-in RAM, which extends the low part of memory, so a 8K expander used with the Super Expander adds nothing new.

These are the most useful combinations for BASIC. The last two configurations represent fully expanded VIC-20s. The version which includes the 16K expander can store more machine language routines or other data, but the extra 8K isn't of much use for BASIC, except in unusual situations requiring a short BASIC program with a large number of variables.

The combinations in the table aren't exhaustive, because one or more 8K expanders can be switched to create an area of RAM which is separate from the rest of RAM. Note that 8K and 16K expanders don't have this possibility unless they're modified. For example, an 8K expander set to start at \$1000 adds 8K to an unexpanded VIC-20's BASIC storage area, but the same expander set to start at \$A000 is independent of BASIC and never corrupted by it. It is perfectly acceptable for a RAM expander at \$A000 to be loaded with a program from a ROM cartridge, which it can then run. Alternatively, VICMON can

be used to write 8K programs direct into RAM at \$A000, although the contents of this area cannot be directly saved to tape.

If you are using BASIC and machine language, it is useful to have reserved RAM unaffected by BASIC, either in a 8K expander with other expansion or in an 8K expander switched to select RAM in a disconnected block.

In practice, strange things may occur when you are a fully expanded VIC, because it is easy to forget that a certain RAM or ROM device is on. For example, programs written for the unexpanded VIC often will not run on expanded VICs, so some expansion memory may need to be turned off and the equipment reset before those programs can be run.

Generally, any program written in VIC BASIC can run in any VIC-20 with enough memory. One it often happens that a VIC won't run a program unless its memory is reconfigured, because some element (such as BASIC's starting address) is in the wrong place. Some tape games, for example, are labelled "No RAM Expansion Necessary" when a more accurate description would be

a differently expanded VIC.

There are two distinct problems here. The first is that the VIC-20 may have expansion fitted so that a program won't run, even though the total memory includes, as a subset, what is needed to run the program. The extra memory has caused the difficulty, for example, the screen may be in the wrong place. Utility programs which automatic when the computer is turned on can also cause this sort of interference with memory. To solve this problem, either the extra RAM must be removed or the VIC must be deprogrammed by software.

Downgrading

In the second case, a program written for a 8K expanded VIC may not run on one with 8K or 16K expansion, or vice versa. Again, the memory is actually in a different position from what is desired. In such cases you could acquire a 8K expander; alternatively, software reconfiguration is worth a try.

Program 2-2 reconfigures the VIC in one of five ways. Downgrading is generally successful, but reconfiguring 8K or 16K expansion to run programs written for 8K expansion is problematical, as the program is simply moved to a new area. For example, Super POKES into locations 33 and 36, which are the top of BASIC, must be removed.

The three reset routines are each useful under different conditions.

Normal reset (as though switching on): SYS 64800

Reset which preserves unexpanded BASIC: SYS 64818

Reset which ignores RAM at \$A000 (for example, Super Expander), giving normal full memory expansion: POKE 783,181: SYS 64813

Program 2 mimics most of the features

Program 2

```

0 PRINT "1. UNEXPANDED VIC": PRINT "2. VIC+8K"
1 PRINT "3. VIC+8K+16K": PRINT "4. VIC+16K"
2 PRINT "5. TRY IX ON 8K BACK": INPUT Y

9 DATA 16,64,15,16,96,16:TOP OF BASIC
10 DATA 32,64,16:REM SCREEN START

```

"Will Not Work With Expansion."

The problem arises because each program assumes that one particular configuration is in use, without allowing for possible differences. Often the programmer has not understood that there could be a problem. Any program which POKES characters to the screen, changes some of the pointers to BASIC, stores its own graphics characters in some fixed location, or relies on the use of supposedly fixed locations within BASIC RAM, is liable not to run in

of VIC's power-on sequence, except the search for an auto-start cartridge and for the limits of RAM, which are POKED in instead. ■

Basic West's book *Programming the VIC* is published by Level Ltd at £6.95, and can be obtained from Midco, Star Road, Partridge Green, Horsham, Sussex.

Going to the top of the class?

Teacher Pam Benner puts educational software to the test, and finds that some programmers just haven't done their homework

THERE IS little doubt that the majority of home computers are bought primarily for game-playing. There is equally little doubt that to use a computer only for playing games is like using a JCB only to crack eggs. A home computer is an immensely powerful tool which, particularly in terms of speed, sound and graphics, can perform many functions better than a human being.

Suspicious

When microcomputers first began to appear in offices, businesses and schools, there were many people, including teachers, who were deeply suspicious of them. Some people still are! They are wrong, but equally wrong are the enthusiasts who see the computer as the be-all and end-all. A computer cannot replace a caring parent or teacher any more than it can do away with the need for office staff. It will not go swimming, it will not dry coats and it will not cook a meal. By the same token it will not, by itself, teach geography or painting, nor impose good standards of behaviour.

So what place does the computer have in education? The teaching of Computer Studies, as an academic subject in its own right, is arguably in decline, as educators realise that the skills of programming and logic are not ends in themselves. Instead, computers are finding their way into all types of classrooms — with all subjects and age-groups — as schools see what means they have available, at a time of education cuts, to wrangle together the necessary money.

The computer, together with commercial or privately-produced software, is a very potent teaching aid. It can be used with a whole class, provided a large enough

monitor is available, but more often it is used with individuals or small groups of children. It is useful in remedying specific difficulties, providing practice or, more effectively, harnessing its graphic and sound capabilities to provide a new perspective on old subject-matter. It is probably at its most valuable when it injects an element of fun into mundane tasks, when the pupil learns without realising that he or she is doing so.

Element, mainly by being set in front of the screen. In fact, it is often argued that permanent damage can be caused by trying to teach a child to read too early, or by using methods which conflict with those used in school.

It is with younger children that these dangers are most apparent. For example, no computer can, by itself, teach a child to read. What it can do is reinforce the enormous amount of background work, which should be provided by parents, in the way of matching shapes, colours and ways of matching pictures, colours and sounds; describing pictures; connecting big with small, soft with hard, and so on. Some software packages provide good documentation and guidance for parents, such as the excellent *Words and Pictures* program from Chalksoft, but with whom this is sadly lacking. It is most important for parents to make that, except in the more overly game-type programs, their active participation is essential. The younger the child, the more important this becomes. So with a covering game, like Microsoft's *Count with Oliver*, the child should be provided with toys or treats in count and move about, as well as those appearing on the screen. Little will be gained by dumping young Johnny in front of the keyboard and leaving him to get on with it. With older children, this active participation is still beneficial, but less crucial.

Pitfall

The other major pitfall, which besets parents and teachers alike, is knowing which software is worth buying. There are four main questions which you should ask yourself before investing in what may be a rather expensive program:

The mice can also perform these functions in the home, but it is here that dangers loom. There is a strong temptation to parents to believe that a computer will teach their two-year-old child to read, or will turn their 5/6-year-old into a future

1) Does it teach anything worth knowing?

2) Does it do anything which could not be done equally well by a book or by a responsible adult?

3) Does it provide enjoyment, or is it merely tedious and uninspiring?

4) Does it use the computer's powers of graphics, sound and almost-instant recall?

An enormous amount of educational software is available for the BBC Micro, mainly because of its Government-inspired monopoly in schools, and it is rapidly being translated for use with the Commodore 64. Much of it is excellent but some is atrocious.

Specialists

The problem of choosing suitable programs is made worse by the fact that most of them are not easily available, except by mail-order, so cannot be viewed before buying. Although some of the software produced by the smaller houses is good, it is perhaps wisest, in those circumstances, to stick to the major specialists in educational software, like Chalksoft, Mirrorsoft and Commodore itself, or to software produced by the heavyweight in educational book publishing, for example Program, Longman and Collins. Such companies have their reputations to consider and, generally, do not release rubbish.

Goldsmith's claim that its *Flashwords* and *Spelling* program is suitable for children from eighteen-months old. The program places jumbled letters on the screen, then sorts them out into words. With some words a picture appears, some-

times cleverly animated. No documentation is included. There is a facility to add extra words and to practice spelling. An infant school headmaster, whom I asked to try the package, was quite scathing. The title could be of some use with early readers, but criticised it for causing confusion by super-imposing letters, for not providing enough pictures and for limiting its words to seven letters.

Chalksoft's *"Words and Pictures"*, on the other hand, does much better. It provides a choice of five pictures for each word, and the user has to match the word, or a simple sentence, to the correct picture. A jumping frog rewards correct answers and, after ten questions, performs a well-known children's song, with animations. With the program comes a very helpful guidebook for parents. This is certainly one of the best programs reviewed.

"Count With Oliver", from Mirrorsoft, consists of two counting games. There is no guidance for parents but the games themselves are excellent. The child is required to count various types and colours of toys and balloons, which appear in a shop window, and, in the more advanced game, to perform simple addition and subtraction. Colourful pictures and clear characters are used throughout, prompts are provided when required, and the difficulty of the exercises is carefully graduated. A very good package, but one which calls for considerable back-up work from an adult.

Also from Mirrorsoft comes *"Look Maay"*, a package of two sets of memory games written by a headmaster, whose expertise shows clearly. *"Old MacDonald's Farm"* is aimed at 4-7 year olds and uses animal pictures in games of snap, of finding the odd-one-out of three pictures and recreating a scene which is displayed on the screen. The second program, *5 O.R.T.*, contains three games to develop observation and memory in children over seven, using a space-travel theme. The games are entertaining, and in use I found them entertaining and challenging for children and adults alike — an excellent test of concentration. In all it is a first-class package, and one of the few which could be of benefit to younger children with little supervision.

"Caesar's Travels", again from Mirrorsoft, is a fine example of a type of

game which is being recognized as particularly effective. A simulation, or adventure-game scenario is used, in which the child has to make decisions based on the antics of Caesar the Cat, from Miramax's arcade game. Choices of action are entered using the function keys, for which a clear overlay is provided. At various times the game tests shape and colour recognition, left and right, simple counting and read safety, as well as providing an excellent reading monitor. Animated graphics and sound are used to great advantage throughout. It is intended for children from three to nine years, but with the younger end of the age-range its use would be limited. An adventure-game story-book is provided with the tape, and the entire product is first-rate.

In contrast are two packages from Shasta Software: *Fun To Learn* and *Master Maths*. Both are intended for children of junior school age, and each provides a suite of simple programs. *Fun To Learn* contains a strange mixture of a counting game, an anagram game, an addition exercise, a type of space hangman and a simple letter code. Except in the hangman game the use of graphics is poor, and the games are boring. *Master Maths* again contains five exercises, this time in mental arithmetic. In only one of these are graphics used of any help, and the others are truly dreadful! It is time programmers realized that providing endless drill in multiplication tables is of little value.

Punctuation

At the other end of the scale, *Punctuation Pete* uses the computer to excellent advantage. Published by Hill MacMillan, it is intended for the 7-11 age range, but could also be of great value to older children who have difficulties with punctuation. The user moves Pete, an animated spider, along lines of text, and uses him to put basic punctuation in the appropriate places. If it is done wrongly, Pete shows where alterations are needed, and finally corrects it himself if necessary. There is an excellent range of passages provided in graduated levels of difficulty. The only criticism I could level is that the program is rather quirky about using commas before conjunct ions, but otherwise I recommend it highly. As a bonus, the other side of the tape carries a database of

words linked by the theme of "travel", and hangman and anagram games which use these words. All in all it is a first-rate piece of software.

Quite the worst piece of software I have seen is *World Geography* from a company having the courtesy to call itself Superior Software. At first it looks impressive, placing a high-resolution map of the world on screen, but all it does is to ask for capital cities and populations of various countries, some of them most obscure. It has a tendency to crash, it allows you to cheat by accepting any non-alphabetic key as a correct solution, and it does not tell you the right answer if you get it wrong. Worst of all, there is little value, educationally, in knowing capitals and populations anyway! Yet this program is being advertised widely, and no doubt many parents will be fooled into buying it, and its sister program, *U.K. Geography*, which is by the same vein.

Vocabulary

The German Master and *The French Mistress*, from Einstein Software, are examples of well-written programs which, nevertheless, fail to exploit the power of the computer. They are vocabulary-testing programs, for use with 11-16 year olds, which are quite sound but do nothing which could not be done as well without a computer, and they fail to allow for differing shades of meaning. For example, the German word "zusätzlich" means "additional" or "extra", yet the program will not accept "additional" as a valid translation. Sound and graphics are not used at all.

The best Q-level software I have found is the series of Shakespeare plays from Penguin Study of Software. These are databases which provide the user with references to themes which arise in the plays, and pose questions which ought to be considered. They will also provide cross-references so, for example, it is possible to see the *Julius Caesar* tape to find references linking "Caesar" with "Ambition" in "Act 1". The programs would be useful for writing essays, for examination revision, and also as a source of ideas for teachers. I asked a specialist English teacher to try *Julius Caesar* and *The Merchant of Venice* and she was most enthusiastic.

Longman's is a highly respected publisher of school textbooks, which has released a range of Q-level revision programs for the Commodore 64. I looked at three of these, in *Mathematics*, *Chemistry* and *Computer Studies*. All of these are quite good although, of course, they are unable to cover the whole syllabus on a single tape. Each provides coverage of four topics which pupils find difficult, and the treatment given is sensible and thorough. To my mind, the "Mathematics" tape is the poorest of those I saw, in that the on-screen presentation is untidy, and it ignores the most difficult aspects of transformation geometry. Nevertheless it is quite sound, and excellent in parts.

The *Computer Studies* package is particularly good, with *Chemistry* not far behind. All of these would be useful for Q-level students, though of less use for CSE. The tapes also include databases, listing topics for revision which are not otherwise covered. These are very comprehensive, but the pupil's own notes would probably be much better.

Mushroom

With over two hundred educational packages on the market already, it is impossible to review them all. What I have tried to do is to cover as wide a range as possible, in terms of subjects and the age-groups for which they are intended, and I have used the views of other teachers and pupils extensively. With the current mushrooming in such software, it is inevitable that some of it should be poor or ineffective. I hope I have provided readers with help in avoiding bad programs, so they will be able to use their judgement, and spend their money wisely. ■

Ride of the Valkyrie

Secret agent Barbara Conway forsakes the lands of magic for the seedy world of conspiracy and kippers

ORIGINAL adventure plots are at a premium and the basis of Random's *Valkyrie 17*, although fairly reminiscent of many a "B" movie storyline, has more originality than most plus the magic ingredients of a sense of the ridiculous. Let's face it, any adventure package based on the cryptic message "the Red Kipper flies at Midnight!" has to have at least some sense of humor.

Background

The plot, at least the part you're allowed to know at the start, is based on events at the end of World War II when you, the player, were an Allied secret agent. Nine years later, it seems that the top-secret "Valkyrie 17" project has been revived by Nazi sympathizers eager for world domination. Our agent has already been killed (the audio track on the tape thoughtfully gives you his last telephone message plus the fact which strongly leads to and now it's up to you to take up the trail from the Gitz' hood overlooking beautiful Lake Brunst and save the world from the mysterious super-weapon.

I mean you, James Bond would probably despair over this one. Your first problem is to get OUT of the Hotel where the staff, with the exception of a friendly maid, would make Basil Fawlty's establishment look like a haven of peace and welcome.

Before escaping, however, there are a number of items you must pick up while dodging the manager and his constant demands for the bill to be paid. You can't do this (don't try fighting with him, though, he's a deadly karate black-belt since you have no money and an excursion into transgression doesn't) find him for a second. Escape is possible, however, and once you've cracked that problem your troubles really begin. In my first five trips to the town and surrounding areas I was killed three times (some of the natives are really hostile and the marine life isn't a lot better) in my desperate search for the elusive Krichensmuller who (I think) is the key to the problem.

The *Valkyrie* scenario spreads a great deal wider than the immediate vicinity of Lake Brunst and you may find yourself returning frequently to the clues on the audio tape as well as to the highly-confusing dossier (complete with special "Valkyrie 17" badge) with the program. There are sound effects (generating the phrase at the hotel at different times can get you different messages) and many locations have graphics which may change according to your actions. A piece of early speculation to get some equipment fields "the appropriately altered planet."

I'm nowhere near solving the mystery yet but I'm having a lot of fun trying. The train

to Coombance has been a bit of a disappointment (maybe Heterich fooled me after all) but I have high hopes of the airstrip, Red Kipper or red herring. *Valkyrie's* good value.

The latest offering from Melbourne House is *Castle of Terror*, a variation on the well-worn "vampire" theme. As it would from this source, the program will accept complex multiple instructions as well as the standard abbreviations and much attention has been paid to the graphics which are described in publisher Mark as having "animated characters".

Mysterious

There are fast, detailed graphics for all locations, some of them containing an element of animation such as the fishworkers or the drinkers in the village pub which is where you learn the purpose of your quest. Buying a gloomy old man a pint (but you've got to save the money first) you learn that his daughter has vanished mysteriously and that the source of this, and other, local evils is believed to be the nearby spooky castle.

With accompanying music, which switches between two themes, you approach the castle after a thorough explanation of the neighbourhood including a quick, and ominous, investigation of the local graveyard.

Everything about the castle, including its entrance, is potentially lethal so don't pin your hopes (I've just given you a clue) on getting in easily.

It's a good professional effort, as you'd expect from Melbourne House, but although some of the graphics are superb, I didn't find it as gripping as *Sherlock* or as entertaining as *Hemlock*. And, at least in my review copy, there were some unfortunate bugs such as the omission of my list, in graphics or text, that the vital letters was present at one location.

Gothic

Despite a superficial similarity of name, *Tower of Babel* from Games Workshop is a very different proposition. This is a Tolkienesque fantasy adventure in which the player is the only hope of the world against an engaging character known as Malcor in the Screaming Shadows. This is not only game with a relatively simple instruction format, but a great deal of thought has obviously gone into preparing responses for all likely commands. Communication is quite important in *Tower* so talk to everyone to try duty or chat-not travellers (no need to talk to Malcor's winged minions, though) and keep a sharp eye out for helpful items. It's not an all-time great, but I found *Tower* rather appealing and the screen lay-out, with a gothic type script, is nicely done.

Animal Magic, from Renark Software, is a quest to find a baby which has been kidnapped while your attention wandered. As suggested by the title, you meet an entire

menagerie, some of whom are potentially dangerous, as you go in search of the missing infant. None of the puzzles should stump experienced adventurers (he will full elephant is afraid of only one thing — and we all know what to look for, don't we?) but it's a serviceable package with spritely graphics for the animals. A bit slow for my taste.

I've been trying my hand at some of the other strategy games from Addictive Woolly, but I can't report my brilliant success with that company's newspaper game (last month). My attempts at *Immaculate in Military Camp* have been crushed with conspicuous ease by my niece, playing

the cynical General Nertz, and my performance as *Admiral of the Fleet in Devonshire* (early 20th century naval battles) was fairly well. For the more competent strategist there are good, detailed scenarios with well-planned graphics. ■

If you are having problems with a Commodore adventure program, write to Barbara Conway c/o Commodore Horizons, 12/13 Little Newport Street, London WC2H 7PP, and she will look at the most common problems in *Tower of Adventure*.

For work or play Voltmace has the answer!

For play The delta 3sc joystick is intended for the most sophisticated user. A lightweight unit designed to be held in hand and operated by the fingers of the other hand. The rotary slide switches cannot be damaged by careless pressure on the joystick and the fire buttons (choice of three) have been tested for millions of operations.

For work The datapad 16c — a different way followed keyboard for the IBM 04. Simply plugs into the two centric ports. Compatible with a cassette program to define the keyboard. In operation just push on the "shift lock" to select keyboard.

Sounds and strings on the C16

Continuing last month's extract from the Commodore 16-Plus/4 Companion by Brian Lloyd — this month, music and more command routines

It is time we explored your computer's sound capabilities. Your computer has three different "voices", and you can use any two of these together. This means that you could have one voice playing a tune and another voice playing the rhythm. Two of the voices produce tones and the other produces white noise (this is useful for explosions and gun shots).

However, before we can produce any sound we have to set up the volume level. To do this we use the VCL command, together with a number from 0 to 8 (8 is maximum VOLUME, 0 is minimum, or OFF). It is best to set the VCL size to maximum, so type in VOLS:

Now all we have to do is to choose a voice and a note and decide how long to play it for. For instance, if we wanted to play the note C on voice one for three seconds then we would type the command SOUND 1,800,180

The number 1 tells the computer that we want to use voice one, the number 800 tells it that we want to play the note C in the third octave, and the number 180 tells the computer that we want the note to last 3 seconds (the length of the note is in sixteenths of a second).

Try changing the 1 of the SOUND command to a 2 and then a 3 to see what the different voices sound like.

As I said before, it is possible to have two voices playing at once. You can either have voices 1 and 2 playing together, or voices 1 and 3. If you type this line you will hear a note being played over the top of white noise

SOUND 1,818,360 SOUND 2,507,360

The SOUND command can be used to play tunes and to create effects.

The computer can continue to carry out other instructions while making a sound, so you may have a tune playing in the background while something else is happening.

The note table covers four octaves, but sharps and flats are not shown. The frequency of the note is given for reference only. The value shown for each note are the ones which you should use as the second number after the SOUND statement. For example, to play the note C (third note shown) for half a second you would use the command

SOUND 1,818,60

NOTE	FREQUENCY (Hz)	VALUE
A	130	11
B	145.5	12

E	2744.0	57
F	2869.3	58
G	2998.6	59
A	3132.0	60

You may play a note of nearly any frequency. If you know the frequency of the note which you require then you can calculate the value to be used in the SOUND statement using this formula

$$VALUE = 1024 - (10000.03 / FREQUENCY)$$

In using GOTO and GOSUB you cannot use a variable instead of a line number with these commands. To make up for this, your computer has been supplied with the commands ON ... GOTO and ON ... GOSUB. These commands will GOTO or GOSUB a line depending on the value of a variable. For instance, if the computer executed this line

```
10 ON ZZ GOTO 2000, 3000, 4000, 5000
```

then it would look to see what number the variable ZZ represents and then GOTO one of the following line numbers depending on that value. If the value of ZZ is 1 then the computer will GOTO line 2000. If the value is 2 then the computer will GOTO line 3000, and so on.

The ON ... GOSUB command works in

exactly the same way as the `ON...GOTO` command, except that it `GOSUB` to a sub-routine which should end with a `RETURN` statement, as with a normal `GOSUB` command.

Program Four simulates a die and uses the `ON...GOSUB` command.

When you see the square brackets in Line 20, this indicates that you should change the text colour to purple and switch on a solid block 3 lines deep and 5 characters wide, with the first block in the character square 17 across and 14 characters down.

The program works in this way:

Line 16: Clear the screen.

Line 20: Change the text colour to purple and print a solid block 3 lines deep and 5 characters wide, with the first block in the character square 17 across and 14 characters down.

Line 30: Choose a random number between 0 and 1, multiply it by six, and round it up before adding one to the result. Assign the final number to the variable `DICE`. If the value of the variable `DICE` is seven, then carry out this line again following a random number between 1 and 6, then adding 1 and rounding down makes it possible that a six will come up. The computer very rarely chooses the highest number possible when choosing a random number and therefore `RND*(6)+6` is almost always less than seven.

Line 40: If the value of the variable `DICE` is 1 THEN `GOTO` the sub-routine starting at line 60. If the value of `DICE` is 2 THEN `GOTO` the sub-routine starting at line 70. If the value of `DICE` is 3 THEN `GOTO` the sub-routine starting at line 90, and so on.

Line 60: Empty `FOR...NEXT` loop—causes a delay before re-entrancing the program.

Line 60: Display a single star at the character square 19 across and 11 down then display the message `ONE` with the 8 in the 17th column across and the 14th row down before returning to the command immediately after the `GOSUB` command which jumped to this routine.

Line 70: Display a single star in the character square 18 across and 10 down then display another star in the character

square which is 20 across and 12 down.

Line 80: Display the message `TWO` with the 7 in the 17th column across and 14th row down.

All lines after line 80 are similar to 60-80—they just display various numbers of stars.

If you are typing in a program from a book or a magazine then it can become very boring having to type line numbers, especially if the lines are numbered evenly (e.g. 10, 20, 30 and so on). In order to speed

up the entry of such programs, and also to make it less boring, your computer has been equipped with an `AUTO` line number command. If you type in `AUTO 10`

and then start typing in a short program you will see that as soon as you have pressed `RETURN` at the end of the first line, the next line numbers will appear for you `AUTO`atically.

The number after the `AUTO` command tells the computer how much each line number is increased by, so if you type `AUTO 50` the computer will number the lines 50, 100, 150 and so on.

Once you come to the end of the program you should press the `RETURN` key without typing anything. For instance, if you have finished your program at line 1500 and the computer displays the next line number 1520 and waits for you to type in some more of your program you should just press `RETURN` without typing anything else.

In some circumstances you may need to reset all the variables in the middle of a program. The easiest way to do this is to use the `CLR` command. The program itself is not stopped or altered in any way.

The `CLR` command is carried out automatically when you alter a program line, or `RUN` a program.

It is often useful to be able to find out the `CHR` code for a character. Fortunately for us, your computer has a command which allows us to find out the `CHR` code for any character without having to look it up in a table. This command is `ASC`.

If you type

```
PRINT ASC("A")
```

You will see the number 65 appear on the screen. 65 is the `CHR` code for the `A` symbol. You can find the `CHR` code for any character like this, all you have to do is enclose the character in quotation marks, and enclose them in brackets, as in the above example.

The `VAL` command is a function which returns the value of a string variable. For instance, if the string variable `B51` had previously been set to 921 then the command

```
Z = VAL(B51)
```

would assign the number 921 to the variable `Z`.

If there is a combination of letters and numbers in the string variable then one of two things will happen. If the string starts with a number then the value returned by the `VAL` command will be the value of that number (e.g. `PRINT VAL("1A1")` would return the value 1).

`STR` is the opposite to `VAL`, for this function converts a number to a string. For instance, if you had a line such as this

```
100 AS = STR(864)
```

then the string variable `AS` would be assigned the characters 864.

The `STR` command will always add a space before the number at the start of the string variable in which the characters are to be stored. For instance, if you entered this program

```
10 SCNCLR: AS = STR(864)
```

```
20 PRINT AS: PRINT LEN(AS)
```

```
30 AS = EIGHT(AS,2)
```

```
40 PRINT AS: PRINT LEN(AS)
```

You will see that a space has been added before the number when it was stored in the string variable `AS`. Line 30 effectively removes this space, and when the string is displayed a second time along with the number of characters in that string, you will see that the space has been removed. ■

The *Commodore 64 Plus/4 Companion* by Brian Lloyd is published by Sunburst Books at £5.95, from bookshops or by mail order.

A two-way affair — micro to micro

Brian Lloyd introduces another form of micro communications — the privately operated bulletin boards which are growing in popularity

IF YOU ARE the sort of person who believes that there must be more to home computing than playing games, then the world of micro communications may be of interest to you. When you enter the field it is like a real live adventure, trying to discover new ways of using your micro to communicate with other micros.

Bulletins

One of the best ways to start is to contact one of the many bulletin board services that are springing up around the country. However, before we look at what we need to access the bulletin board services, a few words of advice would not go amiss. Nearly all bulletin boards are run by private individuals who give up a tremendous amount of their free time and, I suspect, a lot of money to provide a free service for you and I, so please do not abuse the system, otherwise the next time you call it up you may not get an answer. Always log on with your proper name and if you are

asked for other details about yourself always tell the truth.

Before we can connect a home micro to one of these bulletin board services we need to have (1) a telephone modem, (2) a suitable RS232 interface, (3) software so that the micros can communicate with each other through the RS232 ports. I use a Telexmod 2 modem together with the Novadesk software that is available free on most bulletin boards.

This program allows you to upload as well as download software from the bulletin boards. The upload part of the program is quite important, as all bulletin boards are essentially a two-way affair with you hopefully contributing your bit to the service. Most bulletin boards run at 300-9600 baud full duplex although a growing number are using the Protol Serial rate of 1200/75. If you read last month's article on modems for the Commodore 64, you should have a fair idea on what modems to buy. However, if you are handy

with a soldering iron you do not have to buy an expensive modem and interface. Magpies sell a modem and RS232 interface in kit form for about sixty pounds, and with a simple program (see listing 1) you are on your way.

Having purchased all the above, what do you get for the bother? As I mentioned earlier, exploring the various bulletin boards is like going on an adventure with every new board you discover offering something new. I will not go into detail as to what each bulletin board offers as this would spill some of the fun, so I will confine myself to what they all provide.

Mailbox

Nearly all bulletin boards offer a type of mailbox service where you can send and receive messages from other users. Advice is something that is always freely available should you find yourself with a micro problem. Many boards allow users to place ads to sell their bits and pieces. There is

usually software to be downloaded free of charge so this is where the Xmodem program will come in handy, but please make it two-way. Don't just download software, upload some of those useful programs and routines you have written in them, so that other people can benefit from them.

The one thing you will always find on any bulletin board service is a very friendly, helpful bunch of people. The system operators (sysops for short) are always willing to offer free advice to anyone.

Now you know something of what to expect, let's try one of the boards from List 1 taking note of the times they operate. First check that your computer, modem, disk drive and so on are connected properly and your modem is set on the correct baud rate (check the modem instruction book). Load the Communications program and run it. Next choose the routing bit. Dial up your chosen number, if you are lucky, and the number is not engaged you should get a whistling sound. Switch your modem on-line and, if all is well, you should be greeted with the board's opening page and perhaps some news items about the system. You will eventually be asked to identify yourself. Answer the prompts with your proper name, as there will be logged so the system will know you next time and can be used for leaving messages for you. Having logged on you will be presented with a menu of what the system offers and how much time you will be allowed on the system.

Operation

There is usually a new user section, and you would be well advised to go through this section and make notes as you go. It would be a good idea to do this on each new board you find, as it could cut down your telephone bill by quite a bit. Please make sure before you telephone, that the board is in operation; all boards do not operate 24 hours a day. You may find that some bulletin boards operate a ring-back system. This means you telephone the board, let

Listing 1

```

8 REM Commodore 64 300/300 BAUD TERMINAL PROGRAM,
10 PONE 53200,00:PONE 53201,00:PONE444,1
11 WAIT 200,44
12 PRINT CHR$(147)
13 PRINT* TELEPHONE COMPUTER*
17 PRINT* *****
20 OPEN 10,0,0,CHR$(165)+CHR$(40)
25 IF PEN(200) < 64 THEN 100
30 GET#10,44
35 IF AA=" " THEN GOTO 25
40 IF ASC(AA) > 75 THEN GOTO 25
50 IF AA=CHR$(13) THEN PRINT AA: GOTO 25
60 IF ASC(AA) < 32 THEN GOTO 25
70 PRINT AA: GOTO 25
100 PONE 200,64:GET 04
110 IF 04=CHR$(17) THEN 04=CHR$(10)
120 IF 04=CHR$(19) THEN 04=CHR$(140)
130 PRINT #10,04:PONE 200,64:04=" " :GOTO 30

```

the telephone ring once and then ring off. You then telephone back again straight away, this time you should hear the whistling sound.

Bulletin board systems are not multi-user, only one person can access it at the time so you will have to be patient if the number is engaged. Don't give up as all bulletin boards are worth looking at and it is usually the most popular ones that are the hardest to get onto.

List 2 is not a full list of all the bulletin boards available as there are many thousands all over the world — it is just a list to get you started. It may be worth checking with your local council as many of them now run their own bulletin board service. If you really get the bug you may like to purchase one of the many books on bulletin boards around the world. If you

want to try the USA, the Computer Telephone Book is worth looking at, especially if you do not have to pay for the telephone calls.

The world of micro-communications is really worth looking into as it opens up all sorts of possibilities and after all, if the reports are to be believed, everyone will be using micros in communication with each other before long. Have fun, but please do not abuse the systems and remember the bulletin boards are provided free for all to use.

If you would like a free listing of the Xmodem program for the Commodore 64, send a large stamped self-addressed envelope (44) plus 20p P.O. to cover cost of printing to:

B. Lloyd, 9 Hornbeam Walk, Wisman, East GM 25. ■

Tales from the Arabianknights

Graham Taylor takes a magic carpet ride with Micromega's first CBM 64 programmer, Hanan Samara

YOU'D BE forgiven for thinking that all computer programmers are males under 30 — it often seems like it. In fact, with the possible exception of adventure games, you might think that computing as a whole was one of the last bastions of male exclusivity.

Hanan Samara is one of the very few female home computer programmers, and her Micromega game *Arab Knights* is one of the more interesting and entertaining Commodore programs released recently.

Hanan has a Master's Degree in maths, and first learnt a computer language, Fortran, as a necessary tool for completing her thesis. "I was working on a scheduling project and found I needed to use a computer," she explains.

Leaving university, Hanan worked with test editors for International Computer Systems and "picked up" Z80 machine code. As she explains it, it sounds easy — there's no hint of false modesty here. Hanan seems to regard it as no great feat.

Moving to Thorn EMI, her Assembly experience earned her a job as program designer and project leader, chiefly on Atari programs.

Her understanding assembly language and writing computer games are not automatically connected. Why games? I asked. Hanan referred to one of the programs which sparked her interest, with obvious enthusiasm. "I remember the first thing I ever saw; it was some sort of children's program involving *Humpty Dumpty*, and was almost like a little movie."

Detail

Last January Hanan set up her own company, Detail Software, with another ex-Thorn employee Adrian Wadley. Detail will concentrate on producing games for other companies to market, and doing conversion and development work to contract. We talked about the thrill of programming in general, and the work on *Arab Knights* in particular.

"The thing that excites me most is getting an idea and gradually turning it into reality through various stages."

"With *Arab Knights* I was drawing on my

own culture as an Arab. I was brought up with stories of Sirhan and gorlas, and it seemed a good idea to use them in a game. You start with the basic idea that you have an *ifreef* to Genies which you must get into a bottle — that's your starting point, so then there's the question of where does the Genie start off, and where is the bottle."

"The final version of the game was quite different from some of my original ideas. I had originally thought it might be set at sea like many of the Sirhan stories." The game is set in the desert, and the process of getting the *ifreef* into the bottle proceeds over four screens. In the first you hunt demons on your magic carpet; on the second you search for the magic door; in the third you look for a basket, and collect a prisoner, and finally you try to trap the *ifreef*.

"From the main idea, it is a matter of

fiddling with it and getting it all down in the form of a story board, just like those used for videos. Once it looked right on the story board the various sprites could be designed by drawing the shapes on squared paper. Actually once the storyboard and designs are right the coding is relatively quick, except where you have specific problems to overcome like making the scrolling smooth and so on."

Commercial

On the Commodore 64 as a programming machine, Hanan recognizes that whatever the drawbacks, the market success of the 64 makes it and the Spectrum vital commercial targets. "Well, since I worked first with the Atari, I tend to favour it. For a machine that old it still has many more features that help the programmer. Nevertheless the 64 is close to the Atari in many ways; at least you get some sprites — with the Spectrum, for example, there's nothing there to work with — you even have to write your own scrolling routines."

Hanan went into more detail about the way she uses the 64 and the problems she faces as a programmer. "Well, eight sprites isn't many, although obviously you can use interrupts to give you multiples of that. The SID chip is tremendously very powerful, but you have to work very hard to set it up — sometimes the restriction on the colours in multi-colour mode is a problem.

"One thing I do like is the way you can get the hardware again to move the A-Y position of the sprites — that's very useful. I guess my worst complaint is about the collision detection routines — all they really tell you is that something has hit something, while what you really need to know is exactly what sprite has hit what."

Returning to *Arab Knights* as a game, I noticed that unlike almost everything else I had played recently, it was actually possible

to complete the game and get through all the screens at the easiest level after only a few plays. Was this intentional? "Oh, yes, definitely. I always make sure a game is possible to do early on, but equally ensure that it gets gradually more and more difficult — to a certain extent this probably reflects US games thinking, which is where much of my work has been done in the past. I recognise that in this country you can get away with things getting tougher earlier — people have more patience here it seems."

Boardgames

The Commodore 64 will feature strongly in Heman's future plans. Four programs are planned: one arcade game which she describes as a kind of race, a program designed for advertising purposes — a kind of stop-window display — and two "board" games. Heman is reluctant to talk about future plans for reasons which are a mixture of business caution and, well, superstition: "I sometimes think that people's ideas float up into the air and into other people's heads."

I did persuade her to say a little more about the board games: "It's an idea we are talking about at the moment to do some computer versions of some board games that are not well known here, but have nevertheless been very successful — we want to do some things which are more complicated than what's been done previously on computers. I'd particularly like to do some things where it isn't all instant response, and you have to think."

With shades of that original Happy Dumpy children's program in mind, Heman

"The thing that excites me most is getting an idea and gradually turning it into reality..."

is also interested in trying to do some educational software. "The problem is that most educational software is so bad. To do something good would need a lot of time and effort."

I asked if Databi would ever market its own games instead of selling them to other people. "Obviously we would like to, but the financial risk and investment is simply too great at the moment." Nevertheless some of Heman's experiences with other nameless companies have instilled a large

degree of caution very quickly.

"I have had quite a few bad experiences; programs I've written have not been advertised properly, and generally the whole business of negotiating contracts is taking up more and more time — those days I won't do any programming at all until the contract is signed — it's just too risky."

Heman adds wistfully: "When you start a software business, you gradually realise there is so much more to it than just programming." ■

REWRITE THE HIGH SCORE TABLES

So, you've got a Commodore. You've also got enemies. With the Gunshot, you'll have all the opposition covering in corners. 8-directional action and an all-in-one moulded stem allows accurate annihilation and strength to survive those all-night sessions. Dual fire buttons for fading fingers (and a rapid fire version when they're really coming thick and fast). And, if you break it (and we know you'll try) our 12-month guarantee will prove invaluable. Only £8.95. The Gunshot plugs directly into the CBM 64 and Vic 20.

Ask about Vulcan interfaces for the C16 and Plus 4.

See the range of Vulcan joysticks and interfaces at your local stockist... we'll see you on the high score tables.

COMMODORE SOFTWARE FILE

Flight Master

FLIGHT MASTER isn't so much a flight simulator, it's more an interactive movie animation.

After the title screen you see the runway displayed, and you take off by pressing the up cursor key. If you release it too soon or press the wrong key you will crash.

Once in the air, you must keep the

screen level and in the middle of the screen by using the four cursor keys. If you can keep level for long enough you will see the landing runway, and you must then land using the down cursor key.

The program demonstrates the C16's superior sound and hires graphics commands.

Our first readers program for the C16 comes from David Marston of London

WILL YOU STILL LOVE ME WHEN I'M 64

Peter Garsand

Designed for anyone who wants to combine the best of both from the Commodore 64, the best software and the best of my education and knowledge generation, and the personal library capabilities that make the creation of unique records to suit their needs (programs are included, covering from your homework, a great vocabulary growing record, efficient guides for related keywords, phrases, meanings and background items. There are sections on the way that makes it all possible, the 64K home Internet Service, and guide of how to program the 64 to read the more different computers. £6.95

Peter Garsand is the author of Using the 64, and a regular contributor to *Micro Action*, *Commodore Horizons* and *Personal Computer News*.

IMPOSSIBLE QUESTIONS FOR THE COMMODORE 64

Kevin Beggs

These questions will enable you to utilize the more hidden areas of your 64. The book contains most of the answers to the questions that give you complete rights, and also provides an insight into how to approach future problems. The topics covered include programming a program to store in disk, moving files, installing programs, identifying yourself from, and how to make a program work not as well as it's loaded. There is a collection of routines to speed up program execution using the internal routines in your 64, and many other files and tips that are always commands to learn. Discovering the Commodore character sets on Super 128K and producing some things too. Each page includes a computerized listing, although a general outline of the idea and a detailed look at how the program was constructed. £8.95

Kevin Beggs is co-author of *The Complete Commodore 64 User's Companion* and a regular contributor to *Personal Computer News*, *Commodore Horizons* and *Personal Computer World*.

Write for a descriptive catalogue with details of other titles.

FAST LOADERS

COMMODORE 64

TAPE TO DISK

R.B.S.

A NEW GENERATION conversion utility, developed from the acclaimed Hypersave-64, R.B.S. converts virtually all your long loading cassette programs to TURBOLOAD, faster than the C64 disk drive. Multi-part and autorun programs are loaded with ease. Converted programs load independently. No additional hardware, no poles, no SYS calls, no user knowledge required. Load "The Hobbit" in 100 seconds. Torpedo, Lightning load, Feedback now obsolete. R.B.S. will convert more programs than any competing utility. Cassette £7.50p.

HYPERSAVE-64

Retaining the flexibility which the programmer demands, Hypersave leaves you in control. 8 additional Basic commands. Save, load, verify up to 48K continuous Ram at HYPER SPEED with full error checking. Converted programs reload independently. Autorun facility. Hypersave also allows a small number of fast loading programs to be converted to Hyperload. Reviewed in Your 64 issue 2. Cassette £7.50p.

DISKUS I

Introducing the new market leader. This is the simplest to use and most efficient tape to disk transfer utility yet devised. No program rewriting is required and transferred programs will automatically run when loaded.

- For single, multi, and autorun programs
- Automatic filename handling
- Efficient use of Disk space
- No user knowledge required

Diskus I will handle several program types which other utilities ignore, including headerless files. A bonus program is included which will transfer a number of fast loading programs to disk. Cassette £7.50p.

PRO-SPRITE

Library, Editor, Animator for single and multicolour sprites. Joystick control. Packed with features. Menu driven. 100% machine code. Complete with your first sprite library. Cassette £7.50p.

COMMODORE 64 OXFORD PASCAL

YOUR FUTURE WITH COMPUTERS DEPENDS ON PASCAL

Oxford Computer Systems
Subsidiary of
Harrington Road
Widdowson

Deloit 047 1 J5 England
Telephone 02636 12700
Telex 82147 HED OCSL

BECAUSE

- PASCAL is the world's most popular programming language after BASIC
- PASCAL is FAST ... up to 20 times the speed of BASIC

WHAT IS OXFORD OXFORD?

OXFORD PASCAL is a COMPLETE implementation of the popular programming language PASCAL, running on the Commodore 64

GRAPHICS & SOUND

With the OXFORD extensions to PASCAL you can programme pleasing graphics and astounding sound

WHAT DOES IT?

With the Cassette version of OXFORD PASCAL you get:

- A powerful text editor for preparing PASCAL programs
- A resident compiler giving 14k of user RAM
- A powerful set of colour graphics and sound extensions to standard PASCAL

With the disk version of OXFORD PASCAL you get:

- All the above, PLUS
- A full disk to disk compiler exploiting the entire memory of the 64 for PASCAL programs

HOW MUCH DOES OXFORD PASCAL COST?

Cassette version resident compiler only £19.95
Full disk compiler (1541, 4040, 8050, 8250 drive) £49.95

Prices are exclusive of VAT. There is also a small charge for post and packing.

ANSWER BACK

Hi-res Raeto

CAN YOU tell me how to make the whole screen high resolution on the IBM 914? The Programmer's Reference Guide doesn't cover this, and Commodore has been unable to help me. Can you explain how to do this and how to plot points on the hi-res screen?

J. Ellerton
Myrtle
Canwell

THE REFERENCE book you need is Raeto West's *Programming the Vic*, which is available from BMMS, Star Road, Parkbridge Green, Hordham, Sussex. The page 423 you'd find a Basic program for full-screen joystick-controlled plotting in 40x80 mode. The program allows plotting and a screen 20 columns by 16 rows in size, in full colour.

Losing pounds

I USE THE brilliant Visiwrite word processor with my 64 and Brother HB15 printer, and have always found Calvin Lacy and Visi to be very helpful in sorting out problems. It's great to find a software supplier who cares about what happens to customers after they've paid for the goods!

Now I'm looking for someone who can tell me how to switch to print the E sign. It's there on the disk/manual, but just you try to print it... when it comes to manuals, the Brother HB15 surely takes the beauty prize. Any knights in shining armour out there? J. Day

Chapel de La Frisk
Derbyshire

THE £ SIGN is character 81 on the 64, and may well be CHR\$(81) on *Ac* as your HB15. It's a matter of trial and error to work it out. Try *Ac* first, and if that does not

print out £ then use a loop as follows:
20 OPEN 1,4
30 FOR I = 20 TO 217
40 PRINT repeat NEXT
50 CLOSE

This should print all the characters on the print wheel and enable you to establish which character corresponds to £. Failing that, your printer may require an escape sequence to be sent in order to access other parts of the print wheel. CHR\$(17) is normally used as Escape, but it's possible your printer may require two characters to be sent. Read your manual carefully and see what is mentioned about escape sequences. It may now make most sense to you.

Going Forth

Is there a version of Forth on disk for the Vic 20? I have the cartridge Forth from Datacube, but I can't find a disk version.

David Carroll
Middleway
London

YOU CAN get Tiny Forth on disk from Atlanta, via Glasgow, 18 Newark Avenue, Borehithe, Lanes, 0794-232364. The program requires a Vic with at least 32K expansion, and is also available for the 64.

Superbase solution

I HAVE A 64, a 1241 and a KDC FT-500 which has a customised parallel interface. I had hoped to use Precision Software's Superbase, which is excellent, but I can't find an interface which allows me to use it with the printer. It seems that all the software based interfaces reside in part of the memory used by Superbase. Can you suggest a reasonably priced interface which will not interfere with the program? P. J. C. Huxton
Fruw
Cirencester

ALL YOU need is a Printlink 64 interface cable available from Microsoft at 7 Clydehill Close, Boreham

Wood, Herts, 01-853 8333. The cable costs around £18. Superbase has a software driver module which provides all the software needed, and if you want to use the Printlink outside Superbase you can buy a software package from Microsoft for £8.

Pay your money . . .

I HAVE A 64 with a 1241 and a Minerva CP80 printer, and a Tripplex printer interface. Could you suggest a suitable payroll program which would cover around 30 employees?

Ray Walsby
Widmore
Cumbria
YOU COULD try Payroll Plus 64 from Landsoft, 28 Stone Lane, London SW14, 01-875 7844. This program rates for up to 300 employees and has no special printer requirements, but it does not provide for statutory sick pay calculations. There is a phone service in case of problems and the program seems easy to use.

Pseudo- random

I HAVE recently discovered a fault on the Commodore 64. After using a short program to generate a random number, I have found that after turning the computer off and trying again the same random number is generated. Could you explain?

Claire Winton
Berley
Essex

THE VALUES produced by the 64's random number generator using RND are always the same when using a positive argument; this is not a fault, and can be used to good effect in some programs. The way to produce a genuinely random number is to use RND(0) as a seed for the number generator, and in a later line use RND(0) for your sequence. Try these power on!

```
10 S=RND(0)
20 FOR=1 TO 10
30 PRINT RND(S)
```

80 column scream

I HAVE A 64 with 1241 disk drive, 1781 monitor and Brother HB15 printer. Using Easy Script I find I have a very good word processing system, but I find the 40-character width screen a drawback. Is there any way I can use this equipment with a monitor or disk based program to increase the screen width to 80 characters? J. Winton
Chesser
Cheshire

I DON'T know of a way of using Easy Script with an 80 column monitor, but even if I did I wouldn't recommend it — the 80 column system I've seen can give you a serious case of eye strain!

Try using the Paper Clip word processor, which can be installed across while being equal to the screen.

VAT attack

MY FATHER runs a shop and has problems with VAT. He has asked me to buy a program for my Vic 20 which will work out 15% of a string of numbers fed into it, but I haven't been able to find one. Can you make any suggestions?

D. Ward
Leath
Leam

IT'S VERY simple to carry out this type of calculation in Basic. Try the following program, which will work for any Commodore computer.

```
10 T=0
20 PRINT "CLR: ENTER NUMBER"
30 PRINT "====="
40 INPUT FN="000"
50 T=T+FN*0.15
60 PRINT "TOTAL VAT AT 15% OF "T" = £".INT
```

If you need help with a technical query or problem write to Jack Cohen, Commodore Horizons, 12-12 Little Newport Street, London WC2R 7PP

COMPUTE!

HOLT SAUNDERS

IF YOU'RE tired of using your computer with an old black-and-white portable TV, or fed up with endless arguments over who gets to use the family set, **DER** has the solution.

The Ferguson MCO8 is a full-function portable colour TV, but because it has DIN sockets for direct RGB and composite video input it also functions as a computer monitor. Because the signal isn't demodulated before being transmitted to the screen, the result is a sharp picture and clear sound. The MCO8 TV/Monitor normally costs £225, including the appropriate connection lead for your CBM or VIC 20, or it can be hired from DER downstream for £1.95 per month.

To win an MCO8 donated by DER, all you have to do is put in order to meet the various features of the unit. For instance, if you think the most important feature is "easily portable" then mark on your entry 1, C — and so on through to A.

When you've done that, complete the following fill-in-sheet in an apt, amusing and original manner in 1000 words or fewer. **DER** puts you in the picture because . . .

Add your name and address and send your entry on a POSTCARD to **DER** Central, Commodore Horizons, 12/13 Little Newport Street, London WC2H 7PP, to arrive by the last day of March. Results will be announced in the May issue. Normal competition rules apply.

The results of the January Beyond Software competition are as follows: the overall winner is M Triggler of Barnstaple, who receives copies of Pd Monitor, Proteus and Lords of Midnight. The first 20 runners-up receive copies of Pd Warrior; Stephen Foster-Baile, Blandford; M J Davis, Llandrillo; P O'Connell, Newcastle; R Richardson, Southwicks; M Bukacinski, Thornton Heath; S Sullivan, Huddersdon; David Gillman, Galway; P McMillan, Aclington; John Whitehead, Tadworth; G J White, Leeds; G Saunders, Birmingham; P B Jones, Milford Haven; I M McKinley, Berwick; C J Newton, Littleover; P Usual, Mablethorpe; R G Chapman, Chorlton; R Smythe, Manchester; W Sinclair, Okeham; C Nelson, Hereford; M A Hutchinson, Llandudno.

The second 20 runners-up receive copies of Proteus for the 64, R. Scoble, Gosforth; R Palmer, Southold; S McCarty, Newark; E M Howell, Bristol; S Conway, Kilham; J Coombes, Stoke; S Skinner, Nottingham; M J Williamson, Boston; M LaValley, Redwood; P Mason, Portsmouth; A Ciniola, Rawdon; M R Bond, Reading; G P W Way, Plymouth; A Marsh, Wotton; D J Stokes, Birmingham; P Rees, Plymouth; D Wright, Hoveham; K Evans, Liverpool; M Perry, Claydon; M Harrison, Stoke-on-Trent.

Every entrant will receive free membership of the Beyond Club, and a voucher entitling them to 20 off the Beyond game of their choice with the next edition of the club newsletter published in May.

DER

Win a new TV/monitor

- * **A** Direct input for a sharp, clear picture
- * **B** No hiss or hum on the sound
- * **C** Easily portable for use in any room
- * **D** Automatic source switching — no need to change connections
- * **E** Full-function colour TV with Ferguson picture quality
- * **F** Modern styling at an affordable price

F-15 EAGLE

An air battle you can win

FIGHTER PILOT

DIGITAL INTEGRATION

FOR TORO can be a high flier with Digital Integration's exciting combat flight simulator **Fighter Pilot**. The Commodore 64 game, reviewed in last month's issue, puts you in the pilot's seat of an F-15 Eagle jet fighter. Your mission is to take off from your home base, track enemy aircraft with your tactical radar, intercept and destroy them, and return safely to base.

The cockpit display is an accurate simulation of the genuine thing, and there are a full range of controls to affect altitude, pitch, weapons status, trim, undercarriage, guns, speed, and more.

Digital Integration is offering twenty copies of **Fighter Pilot II**, which normally costs £8.95, to Commodore Horizon readers.

All you have to do is look at the map and follow these instructions. Each square is one mile on each side.

Starting from point A, you taxi onto the runway and take off heading north. After passing over a body of water you alter course to north-west and fly for one minute at 600 miles per hour. You spot an enemy installation and alter course due west. Flying at 1200 miles per hour for a quarter of a minute, you then veer south for three miles, and, coming under enemy attack, alter course south-west until you pass over a body of water. You then fly south-east for seven miles, when your fuel warning light goes on. You have to land on a distress call — but what are your coordinates?

To win a copy of **Fighter Pilot**, write down the number-letter code for the square, then complete the tin-breaker in an apt, amusing and original manner in fifteen words or fewer: "I want to reach for the skies with **Fighter Pilot** because..."

Send your entries on a POSTCARD with your name and address to **Fighter Pilot Competition**, Commodore Horizons.

15/15 Little Newham Street, London WC2H 9PP. Competition closes on the last day of March and results will be announced in the May edition. Normal competition rules apply.

Previous winners:

The winners of the January **Chess RAT** competition are Mark Riley, Harlow; Jamie Roche, Poole; B Palmer, Stafford;

M LeVallon, Poole; Dean Owen, Great Harwood; P Buxby, Hall; P Bets, Plymouth; and H Jones, Straton. Each will receive a Chess RAT infrared joystick plus a copy of the game **Portis of Bear George**. The winner of the November **Diana's Telescope** competition is C M Terry of Nottingham. The prize is a Prime Astrol 400 telescope from Dixon's.

Koala Pad Touch Tablet

JUST PICTURE IT!

JUST PICTURE IT - BEING ABLE TO DRAW YOUR OWN HIGH RESOLUTION GRAPHIC DESIGNS ON YOUR COMPUTER SCREEN WITHOUT HAVING TO WRITE A PROGRAM . . . !

Well, now you can - with the amazing Koala Pad from Audiogenic!

The Koala Pad touch tablet provides the direct link between you and your screen! It plugs into your Commodore 64 and lets you paint directly onto the screen with a selection of brush sizes and a choice of 16 colours and 16 shades from your software palette.

But that's just the beginning - because every Koala Pad package includes the incredible Koala Painter software which makes it child's play to . . .

- Fill outlines with a colour!
- Draw straight lines!
- Make frames!
- Draw circles!
- Fill/refill from a point!
- Move objects around!
- Copy shapes!
- Create mirror images!
- Zoom in-on-an-are!
- Swap shapes between fire pictures!
- Save your pictures to disk or tape!

The program is controlled entirely from the tablet by moving a cursor arrow around to the different menu options. An optional Programmer's Guide is also available to tell you how to incorporate Koala Pad pictures into your own programs.

Now you don't have to be an experienced programmer to produce real high-resolution graphics on your computer - the Koala Pad from Audiogenic makes it as easy as a pencil and paper. *Just picture it!*

Available with Cassette or Disk software for the Commodore 64

From all good computer shops - or direct from Audiogenic - just fill in the coupon!

Please send me (QTY) Koala Pad Disk/Cassette! I enclose cheque/P.O. for
