DISCLAIMER AND LIMITED WARRANTY

This software product and the attached instructional materials are sold "AS IS" without warranty as to their performance. The entire risk as to the quality and performance of the computer software program is assumed by the user. The user, and not the manufacturer, distributor or retailer assumes the entire cost of all necessary service or repair to the computer software program. TRONIX shall have no liability or responsibility to the purchaser or any other person or entity with respect to any liability, loss or damage caused or alleged to be caused directly or indirectly by this product, including but not limited to any interruption in service, loss of service, loss of business and anticipatory profits or consequential damages resulting from the use or operation of the software, hardware or documentation portions of this product.

However, to the original purchaser only, TRONIX warrants that the medium on which the program is recorded will be free from defects in materials and fitfully workmanship under normal use and service for a period of ninety (90) days from the date of purchase. If a defect in the medium should occur during this period, the medium should be returned for repair or replacement to TRONIX or to its authorized dealer. After this 90-day period, media inoperable for any reason may be returned to TRONIX only along with \$5.00 for prompt replacement.

The above warranties for goods are in lieu of all other express warranties and no implied warranties of merchantability and fitness for a particular purpose or any other warranty obligation on the part of TRONIX shall last longer than ninety (90) days. Some states do not allow limitations on how long an implied warranty lasts, so the above limitation may not apply to you. This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

Notice:

Upon receipt of this computer program and associated documentation, TRONIX grants to you a non-exclusive license to execute the enclosed software and to make back-up copies of some of these computer programs for your personal use only, and only on the condition that all copies are conspicuously marked with the same copyright notices that appear on the original. This software and accompanying instructional materials are copyrighted. You are prohibited from reproducing, translating or distributing the software or instructional materials in any unauthorized manner.

No portion of the software contained within this product may be incorporated within or included with another computer program that is to be sold, reproduced or transferred to other parties in any way without the express written permission of TRONIX. A run-time package of the speech synthesis program is available to be licensed directly from DONTASK. For further information contact:

Notice:

TRONIX does not guarantee the compatibility of the S.A.M. programs with any other software packages, languages, operating systems, or hardware devices other than those specifically discussed in this manual.

Information on compatibility with specific products may from time-to-time become available upon request from TRONIX.

Congratulations!

You have just purchased S.A.M.—the Software Automatic Mouth—a versatile, high-quality speech synthesizer created entirely in software. You have added quality speech to your personal computer for a lower cost than ever before possible and, in the bargain, have gained features that other speech synthesizers cannot offer.

S.A.M. is designed to be easy to use. With a couple of simple program statements, you can add speech to your BASIC or assembly-language programs. When you have mastered the easy-to-learn phonetic alphabet, the inflection system and the use of pitch and speed controls, you will be amazed at what you can make S.A.M. do. And, until then, it will already match the performance of other speech synthesizers.

We strongly suggest that you read this manual carefully while learning to use S.A.M. There are thorough discussions of S.A.M.'s features with illustrative examples of how to implement them. There is also a dictionary of useful words and their phonetic equivalents to help you learn the phonetic spelling system.

Also remember that as a registered S.A.M. owner, you are entitled to our services in answering your S.A.M.-related questions, providing updates and improvements to the S.A.M. program at nominal cost, and helping you with your applications of S.A.M. Yes, this is a not-too-subtle hint that you should send in your S.A.M. owner registration card today. We look forward to hearing from you.

The S.A.M. diskette contains the following programs:

- 1. S.A.M.—**
This program automatically loads the S.A.M. speech synthesis program, KNOBS, the S.A.M. Wedge and leaves the computer ready to accept phonetic input.
- 2. RECITER—**
RECITER is the English text-to-speech program that interfaces the S.A.M. program with ordinary English text input. It is not used for phonetic input and is loaded in separately only when English text input is desired (see S.A.M. Wedge instructions).
- 3. SAYIT—**
SAYIT is a BASIC program that allows you to enter strings of phonetic or English text and hear them spoken immediately. All of the special features of S.A.M. (pitch control, speed control, KNOBS, etc.) can be accessed within the menu-driven SAYIT program.
- 4. DEMO—**
A BASIC program that demonstrates some of S.A.M.'s features, including the capability to change his voice and the ability to sing!
- 5. SPEECHES—**
Another BASIC program that features some familiar texts spoken aloud by S.A.M.
- 6. GUESSNUM—**
A talking game in which the player guesses a secret number between 1 and 100. **We suggest that you do not write additional data on the S.A.M. diskette. Remove it after loading the desired programs.**

S.A.M. is a self-contained machine language program. Your interface to S.A.M. is BASIC is the S.A.M. Wedge, another machine language program. To load S.A.M. and install the S.A.M. Wedge into your C64 computer, follow these instructions:

Diskette Version:

1. Insert the S.A.M. diskette into your disk drive.
2. Type
LOAD "SAM"8 < RETURN >
3. When the computer prompts READY, type RUN < RETURN >.

Running the Demo Programs

Once S.A.M. is loaded into your computer, you are ready to run any of the BASIC demonstration programs (SAYIT, DEMO, SPEECHES and GUESSNUM). To do so, follow these steps:

Diskette Version:

1. Insert the S.A.M. diskette into your disk drive. Close the disk drive door.
2. Type
LOAD "filename"8 < RETURN >
where filename is SAYIT, DEMO, SPEECHES or GUESSNUM.
3. Type
RUN < RETURN >

S.A.M. patches into Commodore BASIC with the use of the S.A.M. Wedge. The S.A.M. Wedge is a machine language utility that adds ten new commands to Commodore BASIC. These commands are used just like any other BASIC commands except that they are used to generate and control S.A.M.'s speech. You can use them in the *immediate mode* in which you simply tell the computer what to do:

Or, you can use them in the *deferred mode* in which the Wedge commands are part of a program:

10 SAY "I AM A TALKING COMPUTER"

The ten new commands are the following:

1. **SAY** [string variable or string]
Commands S.A.M. to speak—

examples:

- a) SAY "MAY4 NEYM IHZ SAE4M" (phoneme string, immediate mode)
- b) 10 SAY "MY NAME IS SAM" (English string, deferred mode)
- c) A\$ = "MY NAME IS SAM"

SAY A\$

(string variable, immediate mode)

String arrays may *not* be used with the SAY command.

2. **PITCH n** Sets S.A.M.'s pitch value to n (see page 16 for values)

example:

10]PITCH 64

3. **SPEED n** Sets S.A.M.'s speed value to n (see page 16 for values)

example:

10]SPEED 72

4. **LIGHT n** Removes the screen display if n = 0, leaves the screen display intact if n = 1. S.A.M. sounds best with the display removed; if the display remains, he will growl a little when he talks.

5. **SAM** Puts S.A.M. into the phonetic input mode.

example:

10]SAM

20 SAY "AY4 TAOK WIHTH FOW4NIYMZ"

6. **RECITER** Puts S.A.M. into the English input mode (provided RECITER has been loaded in [see 8 below]).

example:

10]RECITER

20 SAY "NOW I TALK WITH ORDINARY WORDS"

7. **KNOBNS n,m** Allow you to change S.A.M.'s voice using the KNOBNS feature (see section on KNOBNS for details). Set the "throat" value with n and the "mouth" value with m.

8. **LOAD** Loads RECITER into memory from the diskette. Make sure RECITER is on the disk you are trying to load it from. When RECITER is loaded into low memory in your C64, it uses approximately 6K Bytes of BASIC memory. If RECITER is loaded into high memory, it only requires 2K of BASIC memory but is incompatible with the DOS Wedge. The S.A.M. Wedge will give you a choice about where in memory to load RECITER.

Phonetic Input to S.A.M.

1. The Phonetic Spelling System

S.A.M. is equipped with a version of the easy-to-learn, very readable International Phonetic Alphabet. There are about 50 phonemes which will let you spell all the words in English. Some sounds from foreign languages are not available in the system at this time.

Why use the phonetic system? There are two compelling reasons: (1) In the phonetic system, all the words will be pronounced correctly; and (2) You can put inflection into the speech however and wherever you want it.

If you have already tried the RECITER text-to-speech program, you know that it does a fair job of pronouncing English words. However, it does make mistakes. Some words sound a little strange and others are difficult to understand. The reasons for this are not hard to understand. English is a language of exceptions rather than rules: words that are spelled alike are pronounced differently ("have" vs. "gave"). A rule system like RECITER cannot pronounce all words correctly unless it stores an enormous dictionary that takes up vast amounts of memory. But the second flaw in text-to-speech conversion is more serious. Such a rule system cannot decide where the stress belongs in what is being said. The phonetic system in S.A.M., on the other hand, allows you to decide where to accent syllables within a word and where to stress words within a sentence.

So it is clear that the preferred way to make S.A.M. speak is with the phonetic alphabet. But how hard is it to use? It's really easier than writing in English because you don't have to know how to spell! You only have to know how to say the word in order to spell it phonetically.

Here is the complete list of phonemes, each presented with a sample word containing its sound. Note that there are many vowels, which is why they are all indicated by two letters rather than one.

The phonemes are classified into two categories: vowels and consonants. Among the vowels are the simple vowel sounds such as the "i" in "sit," the "o" in "slot," and the "a" in "hat." These vowels do not change their quality throughout their duration. There are also vowels called diphthongs such as the "r" in "site," the "o" in "slow," and the "g" in "gate," as well as the "oi" in "oil" and the "ow" in "how." These vowels start with one sound and end with another (e.g., "oi" glides from an "oi" sound to an "ee" sound).

The consonants are also divided into two groups: voiced and unvoiced. The voiced consonants require you to use your vocal chords to produce the sound. Such sounds as "b," "t," "n" and "z" fall into this category. The unvoiced consonants, on the other hand, are produced entirely by rushing air and include such sounds as the "p," "t," "h," and "sh" sounds.

Phonetic Alphabet for S.A.M.

The example words have the **sound** of the phoneme, not necessarily the same letters.

VOWELS		VOICED CONSONANTS	
IY	feet	R	red
IH	pin	L	allow
EH	beg	W	away
AE	Sam	WH	whale
AA	pot	Y	you
AH	budget	M	Sam
AO	talk	N	man
OH	cone	NX	song
UH	book	B	bad
UX	loot	D	dog
ER	bird	G	again
AX	gallon	J	judge
IX	digit	Z	zoo
DIPHTHONGS		ZH	pleasure
EY	made	V	seven
AY	high	DH	then
OY	boy	UNVOICED CONSONANTS	
AW	how	S	Sam
OW	slow	SH	fish
UW	crew	F	thin
		TH	poke
		P	talk
		T	cake
		K	speech
		CH	ahead
		/H	

The following symbols are used internally by some of S.A.M.'s rules, but they are also available to the user.

YX	diphthong ending
WX	diphthong ending
RX	R after a vowel
LX	L after a vowel
/X	H before a non-front vowel or consonant
DX	"flap" as in pity

SPECIAL PHONEMES	
UL	settle (= AXL)
UM	astronomy (= AXM)
UN	function (= AXN)
Q	kitten (glottal stop)

Note: The symbol for the "h" sound is /H. A glottal stop is a forced stoppage of sound.

On the phoneme chart, you will notice six phonemes—YX, WX, FX, LX, /X, /X, and DX—which are described as being used by S.A.M.'s rule system. However, they have been provided with letter codes so that you may experiment with these special sounds directly. YX and WX are weaker versions of Y and W. FX and LX are smooth gliding versions of F and L. /X is the "h" sound in "who," and DX is the quick flap of the tongue on the upper palate as in the word "ply."

We are now ready to transcribe ordinary speech into its phonetic representation. Let's use the following sentence as an example:

I do my calculations on the computer.

The first step is to say each word aloud and decide how many syllables are in the word. A syllable has one vowel phoneme and its associated consonants (if any). We then identify the proper vowel phoneme by comparing its sound to the sounds listed in the table, and do the same for the consonants. The resultant combination of phonemes is the phonetic representation of the syllable. We do this for each syllable in a word.

In our example, the first word—"I"—is a single phoneme, the diphthong "AY." The next word—"do"—is a single syllable comprised of the diphthong "UW" preceded by the voiced consonant "D." The phonetic spelling is therefore "DUW." Similarly, the third word—"my"—again uses the "AY" sound, this time preceded by an "M," resulting in "MAY."

The word "calculations" has four syllables. The first syllable transcribes as "KAEL." The "c" sound is pronounced as "k," unlike the "s" pronunciation in a word like "cell" (notice there is no "C" in the phoneme table). The next syllable—"tu"—transcribes as "KYUW." Note here that the "y" sound prevents this syllable from being pronounced as "too." The third syllable comes out as "LEY," and the fourth becomes "SHAXNZ." This word ends with a voiced sound "Z," and not the hissy "S" sound as in "list." You will rapidly discover that many words contain the phonetic combinations "AXL," "AXM," and "AXN." To enhance the readability of the phonetic spelling, the special symbols "UL," "UM," and "UN" can be substituted for these combinations. The "ions" syllable is now written as "SHUNZ." So, "calculations" becomes "KAELKYUWLEYSHUNZ."

The next word "or" becomes "AAN," and "the" becomes "DHAX." By the way, if the word "the" precedes a word beginning with a vowel, it gets pronounced "thee" and is spelled "DHLIY." You should also notice that the "th" letter combination has two phonetic representations: unvoiced (TH) as in "thin," or voiced (DH) as in "the."

By now, the steps used in getting from "computer" to "KUMPUWTER" should already be obvious. Try it.

Once you get used to the phonetic system, it will seem very easy and obvious. Initially, there will be some spellings that seem tricky (Did you know that "adventure" has a "CH" in it?). However, the rule is always to write the word the way you say it, not the way you spell it.

To help you learn the system fast, we have provided an English-to-phonetic spelling dictionary of almost 1500 words. Many common words are in the dictionary; some unusual ones are in it as well. If you are really stuck on how to spell a word that isn't in the dictionary, think of another word that sounds like it and that one may be listed.

In any case, don't hesitate to experiment with the phonetic spelling system. Let your ears be your guide. This system is easy to learn, easy to use, easy to read, and you will be amazed at what you can do with it.

II. Adding Stress to S.A.M.'s Speech

In the phonetic mode, S.A.M. is capable of speaking with a great deal of intonation and emphasis. This gives a much more natural and understandable quality to the speech than is otherwise possible.

The stress system for S.A.M. is particularly easy to use. There are eight stress markers that can be used simply by inserting a number (1-8) after the vowel to be stressed. For example, the monotonous pronunciation of the word "hello" produced by the phonetic spelling "HEHLOW" becomes a much friendlier sounding greeting when spelled "HEH3LOW."

Why do you have to put in the stress markers? Simply because they can go anywhere and S.A.M. has no way of knowing where you want them to go. The following simple example will demonstrate this point to you. Use the SAYIT program on your S.A.M. disk to hear the following sample phrases.

We will have S.A.M. say

"Why should I walk to the store?"

in a number of different ways.

1. WAY2 SHUH7D AY WAO5K TUX DHAH STOH5R.
(You want a reason to do it.)
2. WAY7 SHUH2D AY WAO7K TUX DHAH STOH5R.
(You are reluctant to go.)
3. WAY5 SHUH7D AY2 WAO7K TUX DHAH STOH5R.
(You want someone else to do it.)
4. WAY5 SHUH4D AY7 WAO2K TUX7 DHAH STOH5R.
(You'd rather drive.)
5. WAY5 SHUH4D AY WAO5K TUX DHAH STOH2OH7R.
(You want to walk somewhere else.)

Each of these stress examples has a slightly different meaning, even though the words are all the same. Stress markers give you the ability to let S.A.M. be expressive.

What do the stress markers do? The number you type tells S.A.M. to raise (or lower) his pitch and elongate the associated vowel sound.

The number system works like this:

- 1 = very emotional stress
- 2 = very emphatic stress
- 3 = rather strong stress
- 4 = ordinary stress
- 5 = light stress
- 6 = neutral (no pitch change) stress
- 7 = pitch-dropping stress
- 8 = extreme pitch-dropping stress

When should you use each of these? It all depends on how you want S.A.M. to sound. Say the words to yourself as expressively as you can and see where your voice rises and falls. Remember, the smaller the number, the more extreme the emphasis will be. Also, the stress markers will help get difficult words pronounced correctly. If some syllable is not enunciated sufficiently, put in a neutral stress marker.

A general rule is that the most important word or words in a sentence get the most stress and the rest of the words get little or no stress. However, words of more than one syllable should have syllables marked on their accented syllables (most dictionaries show which these are if you are uncertain).

We will now assign stresses to our first example sentence about doing calculations on the computer. The first word "AY" is usually an important word (Can you think of anyone more important?). We will write it as "AY4", assigning ordinary stress. "DUW", the only verb, is also important. We'll try "DUW4". "MAY" isn't very strong (unless you want to draw attention to it), and it is a single syllable, so we will leave it alone. "KAELKYUWLE EYSHUNZ" is polysyllabic so we must identify the accented syllables. It is also the most important word in the sentence so it will have the strongest stress. "LEY" has the primary stress and "KAEL" receives the secondary stress, so we will write "KAELKYUWLE EY3SHUNZ". "AAN" and "DHAX" are short, unstressed words. "KUMPYUWATER" has a single accent on "PYUW" and gets written "KUMPYUWATER". So, our original sentence gets written

AY4 DUW4 MAY KAELKYUWLE EY3SHUNZ AAN DHAX KUMPYUWATER.

Try typing it into the SAYIT program compared to the unstressed version.

How about really unusual stress? When you place extraordinary emphasis on a word, you do so by elongating its vowel sounds. S.A.M. can do the same thing. For example, a call for help can become "HEHSEH4EH3EH2EH2EH3EH4EH5EHL P". You can always do this with the ordinary vowel sounds, but be careful with the diphthongs. They are complex sounds and if you repeat them, they will not do what you want (e.g. "OYOYOYOYO" sounds just like it reads in English). To extend the diphthong sounds, you need to break them into component parts. So "OY" can be extended with "OHCHYIYIY" and "AY" can be extended with "AAAIYIYIY". You should experiment to find out just what you can do.

Unlike many other speech synthesis systems, S.A.M. allows you to control consonant stresses directly. This is usually done to produce a special tonal pattern in a word. Sometimes you might want a pitch rise on the final phoneme occurring just before a comma. For example, try typing: "AY4 YUWZ SAE5M3, AE4ND RYSAV4TER." Notice how the pitch rises on the "M." It is never necessary to specify stress for a consonant occurring immediately before a stressed vowel. This is handled automatically.

Try to become familiar with the stress marker system. It makes all the difference between an ordinary speech synthesizer and the very expressive S.A.M.

III. The Effects of Punctuation

S.A.M. understands four punctuation marks. They are the hyphen, comma, period and question mark.

The hyphen (-) serves to mark clause boundaries by inserting a short pause in the speech. It also has other uses to be discussed later. The comma marks phrase boundaries and inserts a pause approximately double that of the hyphen. The question mark and period mark the end of sentences. The period inserts a pause and also causes the pitch to fall. The question mark also inserts a pause, but it causes the pitch to rise. Notice that not all questions should end with a question mark (rising pitch), only those that requires a yes-or-no answer. ("Are we hiking today?" rises; "Why are we going to the woods?" falls at the end and should be marked with a period.)

IV. Final Notes on Phonetic Input

S.A.M. is capable of speaking only 2.5 seconds of speech without a break, which is the size of his "breath". If the string to be spoken exceeds this, S.A.M. will insert short breaks every 2.5 seconds. S.A.M. always breaks at punctuation marks in anticipation of the following phrase. So, if you don't like where S.A.M. broke up a phrase, you can specify your own breaks with hyphens. An example of this is: "I use the telephone - to call out of town."

S.A.M. uses the spaces between words to make his sentence-breaking decisions. If a single word requires more than 2.5 seconds to say, S.A.M. will not be able to insert his own breaks and will therefore be unable to say the word.

In summary, the procedures outlined above may seem complex, but this is because they were presented in fine detail. In reality, the steps become automatic, and you will soon be able to type in phonetics almost as fast as you can type English text.

S.A.M. is capable of speaking in a wide range of tones and at many different rates. Both pitch and speed controls are accessed by single POKES to memory locations.

The following chart shows the effects of different values in the pitch and speed registers.*

PITCH

JPITCH N

N =

- 00-20 impractical
- 20-30 very high
- 30-40 high
- 40-50 high normal
- 50-70 normal
- 70-80 low normal
- 80-90 low
- 90-255 very low

default = 64

SPEED

JSPEED M

M =

- 0-20 impractical
- 20-40 very fast
- 40-60 fast
- 60-70 fast conversational
- 70-75 normal conversational
- 75-90 narrative
- 90-100 slow
- 100-225 very slow

default = 72

* See the memory reference chart for these locations.

In recent years, many new speech synthesizers have appeared in the marketplace. The techniques they use vary widely depending on the intended application. Most synthesizers found in consumer products, such as talking televisions or microwave ovens, use a "speech compression" technique of one sort or another. These techniques require a person to speak the needed words or entire sentences. The speech waveform is then "compressed" using a mathematical algorithm and, as a result, can then be stored in a memory chip without taking up a lot of room. The synthesizer's job is to then take this compressed speech information and expand it back into the original waveform. Some of these systems work quite well, retaining the speaker's intonation and sometimes even his or her identity. The processes used in such synthesizers differ greatly from those used in unlimited vocabulary synthesizers like S.A.M.

Let's follow the evolution of an unlimited vocabulary speech synthesizer. First, we must define the task. Simply, we want to create a system that will synthesize any English utterance. One way to begin would be to record every possible utterance on tape and just play back the right one whenever we need it. This would take up more tape or computer memory than could ever exist, so this method is obviously not too practical.

The next method might be to record all the English words and play them back in a specific order to create sentences. This is certainly practical. It would take up a large amount of memory, but it would work. However, we have lost something in this process. The words now sound disjointed because we have "spliced" the sentence together. Also, the stress or inflection pattern of the sentence is either wrong or non-existent. If we wanted an accurate stress pattern, we would need to record every word in a number of different styles, at different pitches, etc.

Such a system needs too much memory. So, let's break things down even further and try to store as little as possible in memory. Instead of storing sentences or words or even syllables, we could store phonemes. Phonemes are the atoms of spoken language, the individual speech sounds. It turns out that English has a little over 40 of them. Wow—this takes up practically no memory at all! We could specify the phonemes in the order we need to create words and sentences and really have ourselves a system. So, we go and record the phonemes and play them back to say the sentence, "I am a computer." Why can we barely understand it? It seems we have broken things down a bit too far. When we chop the words down to this level and then try to reassemble them, everything that blends one sound into another is lost and the results are nothing less than horrible.

But all is not lost. Our efforts are not wasted because we have the acoustic-phonetician to come to our rescue. These people deal in the study of speech sounds, and they can tell us just how to repair our phoneme-based system. First, instead of recording the actual speech waveform, we only store the frequency spectrums. By doing this, we save memory and pick up other advantages. Second, we learn that we need to store some data about timing. These are numbers pertaining to the duration of each phoneme under different circumstances, and also some data on transition times so we can know how to blend a phoneme into its neighbors. Third, we devise a system of rules to deal with all this data and, much to our amazement, our computer is babbling in no time.

- JERROR** Beeps twice when you input a phoneme string to S.A.M. and a phoneme spelling `€` is detected. To find out where the error occurred, use the **JERROR** command. The command will print out the phoneme string with the improper character in inverse video. If no error is detected, the **JERROR** command has no effect.
- JQUIT** Removes the S.A.M. Wedge thereby allowing you to maximize free memory or use other conflicting wedges. To learn how to free up this additional memory, see the section on **MEMORY USAGE**.

Wedge commands 2-10 may be abbreviated by the use of the first two or more letters in the command (i.e. `JPTCH--> JPI`).

Programmers should note that Wedge commands require the following syntax in IF-THEN statements:

```
10 IF A$ = "YES" THEN: SAY "VERY GOOD":
rather than
10 IF A$ = "YES" THEN SAY "VERY GOOD":
```

The colon after THEN is required.

The S.A.M. Wedge is compatible with the DOS Wedge (DOS 5.1); if RECITER is used, be sure it is loaded into low memory.

Using KNOBS

KNOBS is a feature of S.A.M. that allows the use of two extra "control knobs" for S.A.M.'s voice. If we make rough analogies to the physical structures that produce speech, these **KNOBS** allow us to adjust the size of S.A.M.'s throat and his mouth. Doing this creates different voices without altering the pitch or speed of the speech (and, of course, you can still do these things independently with S.A.M.).

To use **KNOBS** in your program, simply issue the command `[KNOBS n,m]` where `n` and `m` are numbers between 0 and 255. A value of 128 in each register results in S.A.M.'s normal voice. Using higher numbers dilates the throat or mouth. Experiment with different combinations of values and see what different voices you can get.

Here are a few sample voices to use from **KNOBS**:

Description	Speed	Pitch	Throat	Mouth
Elf	72	64	110	160
Little Robot	92	60	190	190
Stuffy Guy	82	72	110	105
Little Old Lady	82	32	145	145
Extra-Terrestrial	100	64	150	200
S.A.M.	72	64	128	128

Example: To have S.A.M. talk like an extra-terrestrial with English text input, use the following little program:

```
10 JRECITER
20 JSPEED 100
30 JPITCH 64
40 JKNOSBS 150,200
50 SAY "I NEED TO PHONE HOME."
```

The RECITER Program

RECITER is an English text-to-speech program that converts ordinary text into phonemes that S.A.M. can understand. You simply supply output strings of 255 characters or less to the program. **RECITER** takes care of the rest.

The program uses about 450 rules to convert English into S.A.M.'s phonetic language. Included among these rules are some stress markers for situations where the stress choice is unambiguous. In addition, S.A.M.'s usual punctuation rules still operate with some additional symbols (" ", " ", " ") being considered as periods. The net result is that even directly-translated English text has a fair amount of inflection.

RECITER also recognizes a number of special characters. Numbers are read aloud, and several others are pronounced as well. If a character is not understood by **RECITER**, it simply isn't passed to S.A.M.

We recommend use of **RECITER** (or any text-to-speech program, for that matter) only for applications where the user has no control of the text. For example, text already in a file, text received over a MODEM and text supplied by users unfamiliar with the phonetic system. Where the highest quality speech with full inflection is desired, we urge you to use S.A.M.'s phonetic system.

Don't be discouraged though. You will find that **RECITER** will do a better job of speaking from English text than other text-translator products.

English-to-Phonetic Spelling Dictionary

The advantage in synthesizing speech in this way are tremendous. We use very little memory for the data and the rules to use that data, and we also gain the ability to specify inflection, timing and intonation. This is because we have not stored actual speech sounds, only their spectrums. (You can think of this as a printer needing only four colors of ink to reproduce all the colors in a picture.)

Now, in actuality, we do not store all the spectrums, but only those that are targets. Each phoneme has associated with it a target spectrum which can be specified with very little data. The target may be thought of as a "frozen" speech sound, the sound you would be making if your mouth was frozen exactly in the middle of pronouncing the phoneme. The timing rules tell the synthesizer how to move from target to target in a manner that imitates the timing of a human talker.

S. A. M. is this type of synthesizer implemented entirely in software. It has the tables of phoneme spectra and timing, together with the rules for using this data to blend the sounds together into any English utterance we may have in mind. We have traded some quality from the method using all the recorded words, but what we have gained is versatility, practicality and the ability to do it all in real time, with very little memory usage, on an inexpensive microcomputer.

Using S.A.M. Without the S.A.M. Wedge

S.A.M. can be accessed in a number of different ways. The easiest way to use S.A.M. from Commodore BASIC is to use the S.A.M. Wedge. However, if (a) your application program requires large amount of RAM and you are running short of memory, or (b) execution speed is a premium consideration, or (c) you are trying to use another wedge that is not compatible with the S.A.M. Wedge, then you may wish to access S.A.M. in a more direct way.

Also, if your program requires parameters other than the speech text to be inputted by the user, wedge commands will not work for this purpose. The other parameters will need to be POKEd into S.A.M.'s registers.

Two BASIC statements are all that are required to make S.A.M. speak. The following statements inserted anywhere in a Commodore BASIC program will cause S.A.M. to say "I am a computer":

```
100 SA$ = "AY$ AEM AH KUMPUWATER"  
110 SYS 39424
```

This way of accessing S.A.M. uses a reserved string variable name SA\$ and a machine language call via the SYS command. The SA\$ string can be generated by all the usual techniques including direct assignment, data statements, text files, etc. Like any other string, however, SA\$ can be no longer than 255 characters.

To use RECITER directly, the same basic technique applies. Assign the desired English text to the string SA\$ and execute a SYS command, this time

```
110 SYS 39430
```

In this mode of operation, S.A.M.'s special features are accessed with POKE commands. For example, pitch is controlled by POKing the desired value into 39439 (i.e. 100 POKE 39439, 73), speed is controlled by POKing the desired value into 39438 and KNOBS requires two POKES for throat and mouth plus a SYS statement SYS 39882. The table on the following page summarizes all the memory locations needed for accessing S.A.M.'s features, as well as the command needed (POKE or SYS).

Using S.A.M. and RECITER from Machine Language

Machine language access to S.A.M. is similar to BASIC access without the wedge except that the programmer has to do the string handling. A string of ASCII characters (the same ones you would use in BASIC) is moved into locations \$9A15-\$9B14. The first character must be in \$9A15 and the last character, a \$9B, return character, marks the end of the string. Bytes after the \$9B are not read by S.A.M. After the string to be spoken is moved into S.A.M.'s buffer, simply execute a JSR \$9A03 command, and S.A.M. will speak. If RECITER is installed and the string is English text, the command becomes JSR \$9A09.

Screen Blank

The screen blanks during vocal output because Direct Memory Access (DMA) causes gaps to be inserted into the speech waveform each time the 6510 microprocessor waits for the VIC video chip to access memory. The audible result is a gravelly quality to the speech when the screen is left on.

The speech quality with the screen on is still quite understandable and you may wish to leave the display on in your program. To do so, simply issue the Wedge command (LIGHTS 1 or POKE the value 1 into the lights register, 39440 (the two commands are equivalent)). To restore the screen blanking, issue a LIGHTS 0 or a POKE 39440/0 command. The lights-on speech is somewhat slower than the blank screen speech; you may wish to speed up the voice to compensate.

S.A.M. shuts off the SPRITES when he speaks as well as turning off the system interrupts. It should therefore be noted that any timing will be affected by the speech. The use of SPRITES will degrade the speech in proportion to how many SPRITES are used.

Using the SAVIT Program

SAVIT is a BASIC program that allows you to try out all of S.A.M.'s features in a very simple way. When you run the program, it will prompt you with the word "SAV:." You can then type in whatever you want S.A.M. to say and he will say it. Simply hitting the RETURN key will cause S.A.M. to repeat his previous words.

If you want to use any of S.A.M.'s special features, press any of the special function keys (F1, F2, etc.), and you will be shown a menu of commands. Type the first letter of the command and SAVIT will ask you for whatever information it needs. The N command will set S.A.M.'s voice back to its standard quality (useful after you make lots of changes), and the E command will bring you back to the SAV: part of the program. Until you give the E command, you may continue to access the features of the SAVIT menu.

Memory Usage and S.A.M.

When you boot S.A.M. into your C64 computer and type PRINT FRE(0), you will notice that you have lost approximately 2.75K of RAM space. S.A.M. takes up approximately 10.75K of memory, so what happened to the other 8K? The majority of S.A.M. is hidden behind BASIC! However, it is possible to use even less memory with S.A.M. Here are a couple of things to do:

1. Type [QUIT:POKE 55,0:POKE 56,154
This removes the S.A.M. Wedge and resets the High Memory Pointer to overwrite the KNOBS routine. This is the most stripped-down version of S.A.M. and uses only 1.5K of RAM. However, you will not have the Wedge or use of KNOBS. Also, don't make this change during a program as it will scramble memory.
2. RECITER can be loaded into two different places in memory. When it is loaded into low memory (just below the S.A.M. Wedge), it uses approximately 6K of RAM. This is in addition to the 2.75K RAM that S.A.M. uses. If you load RECITER into high memory, the majority of RECITER is placed into memory locations \$C000-\$CFFF. This version takes up only 2K of RAM, but it might conflict with other programs and utilities that use the same space.

Important Addresses

	POKE/SYS?	DECIMAL	HEX
